1. Description of Alternate ACCESS for ELLs English Language Proficiency Test

1.1 Purpose of Alternate ACCESS for ELLs

The purpose of Alternate ACCESS for ELLs (hereafter, Alternate ACCESS) is to assess the developing English language proficiency (ELP) of English language learners (ELLs) with significant cognitive disabilities in Grades 1–12 in the states of the WIDA consortium. The assessment is rooted in the *Alternate English Language Development (ELD) Standards for English Language Learners with Significant Cognitive Disabilities* of the WIDA Consortium. Alternate ACCESS is a first of its kind attempt made by WIDA to assess ELP for ELLs with significant cognitive disabilities.

The WIDA ELD Standards are aligned to WIDA Consortium state academic content standards and form the core of the WIDA Consortium's approach to instructing and testing academic English for ELLs with significant cognitive disabilities. Alternate ACCESS, which was developed based on the WIDA ELD Standards, may thus be described as a standards-based ELP test designed to measure proficiency for ELLs with significant cognitive disabilities. It assesses social and instructional English as well as the language associated with Language Arts, Mathematics, and Science within the school context across the four language domains of Listening, Reading, Writing, and Speaking.

Major purposes of Alternate ACCESS include¹:

- To meet federal accountability requirements for assessment practice for ELLs and students with disabilities as specified in No Child Left Behind (NCLB; 2001) and the Individuals with Disabilities Education Act (IDEA; 2004)
- To provide educators with a measure sensitive to ELP growth of ELLs with significant cognitive disabilities
- To provide placement, progress, proficiency and program development

1.2 Format of Alternate ACCESS

1.2.1 Integration with the Standards

The design of Alternate ACCESS is built upon the foundational WIDA ELD Standards. The four WIDA ELD Standards represented are:

Standard 1—Social and Instructional Language

ELLs communicate in English for **social and instructional** purposes in the school setting.

¹ From the WIDA Alternate ACCESS website, http://www.wida.us/downloadLibrary.aspx

Standard 2— Language of Language Arts

ELLs communicate information, ideas, and concepts necessary for academic success in the content area of **Language Arts**.

Standard 3—Language of Mathematics

ELLs communicate information, ideas, and concepts necessary for academic success in the content area of **Mathematics**.

Standard 4—Language of Science

ELLs communicate information, ideas, and concepts necessary for academic success in the content area of **Science.**

For practical purposes, the four Standards are abbreviated as follows in this report:

Social and Instructional language: SI

Language of English Language Arts:

LA Language of Mathematics: MA

Language of Science: SC

The selected response items and performance-based tasks on Alternate ACCESS target these four Standards.

1.2.2 Grade-level Clusters

The WIDA ELD Standards describe developing ELP for five grade-level clusters. These are PreK-K, 1-2, 3-5, 6-8, and 9-12. A Kindergarten version of Alternate ACCESS, however, is not currently available. Thus, Alternate ACCESS is organized into the following grade-level clusters: 1-2, 3-5, 6-8, and 9-12.²

1.2.3 Language Domains

The Alternate ACCESS test includes individual sections to assess each of four language domains: Listening, Reading, Speaking, and Writing.

1.2.4 Language Proficiency Levels

Alternate ACCESS assesses growth in ELP over six levels. These six levels include three newly developed language proficiency levels and three levels that derive from the WIDA ELD Standards for the general population. The most basic proficiency is Proficiency Level (PL) A1: 'Initiating,' and the most advanced stage of language proficiency described is PL 3: 'Developing.' The first three levels of the Alternate ELD PLs, A1–A3 are language proficiency antecedents to the existing WIDA ELD PL1 that applies to the general student population. An important aspect of the Alternate ELD levels (A1–A3) is that they represent small chunks of language growth within PL 1. A highlight of this structure is that progress in language acquisition for students with significant cognitive disabilities can be identified in smaller and narrower gradations.

² The organization of grade-level clusters is based on the 2007 WIDA ELP Standards (WIDA, 2007).

Figure 1.2.4A below presents a conceptualization of the proficiency levels assessed in Alternate ACCESS. In this figure, PL1 has been stretched for illustrative purposes to display levels A1–A3.

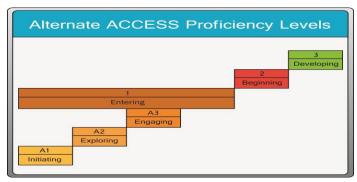

Figure 1.2.4A. Alternate ACCESS Proficiency Levels

These language proficiency levels are thoroughly embedded in the WIDA ELD Standards in a two-pronged fashion.

First, they appear in the **performance definitions**. According to the WIDA ELD Standards, the performance definitions provide a global overview of the stages of the language acquisition process. As such, they complement the **Alternate Model Performance Indicators** (AMPIs) for each language proficiency level (see the next paragraph for further description of the AMPIs).

The performance definitions are based on three criteria. The first is students' increasing comprehension and production of the technical language required for success in the academic content areas. The second criterion is students' demonstration of oral interaction or writing of increasing linguistic complexity. The final criterion is the increasing development of phonological, syntactic, and semantic understanding in receptive skills or control in usage in productive language skills.

Second, the language proficiency levels of the WIDA ELD Standards are fully embedded in the accompanying AMPIs, which exemplify the Standards. The AMPIs describe the expectations for ELLs with significant cognitive disabilities for each of the four **Standards**, at the four different **grade-level clusters**, across four **language domains**, and at each of the **language proficiency levels**. The sequence of these five AMPIs together describes a logical progression and accumulation of skills on the path from the lowest level of ELP to full proficiency for academic success. This progression is called a "strand."

Each selected-response item or performance-based task on Alternate ACCESS is carefully developed, reviewed, piloted, and field tested to ensure that it allows students to demonstrate accomplishment of the targeted AMPI. (See the sample items at the WIDA website [https://www.wida.us/downloadLibrary.aspx] for examples.)

1.3 Test Development

1.3.1 Item Development

Items developed for Alternate ACCESS were field tested on Form 100 and included on Form 101. The initial item writing for Alternate ACCESS was done during the grant phase of test development at the University of Wisconsin. The subsequent pool of items was then refined by the CAL test development team. An internal review of the items was conducted, and items were

chosen for further development based on how well they fit the Standards and AMPIs. The chosen items were refined by CAL staff before proceeding through further test development activities.

Upon internal revision and development of test forms, CAL conducted the following test development activities, each followed by further internal review and revisions: Bias and Content Reviews, Pilot Testing, and WIDA/SEA's Forms Review. Details regarding this portion of the test development cycle can be found in the *Alternate ACCESS for ELLs Technical Report for Form 100*.

1.3.2 Field Test

Field testing of Alternate ACCESS Form 100 was conducted from March 12 to June 1, 2012. The purpose of the field test was to collect data on items and tasks, to judge the strength of individual items and tasks, to develop the Alternate ACCESS reporting scale, and to conduct the Standard Setting Study.

In total, 1,912 students in Grades 1-12 in 15 WIDA states participated in the field test. Participating SEAs encouraged educators in their states to sign up for the field test through the regular ACCESS for ELLs test ordering site provided by MetriTech, Inc. The administrations were labeled as an operational field test, meaning states had the option of designating participation in the testing as a field test activity or as the first operational testing opportunity of the Alternate ACCESS program. For more details about the field test please refer to the *Alternate ACCESS for ELLs Technical Report for Form 100*.

1.3.3 Scaling

Scaling is the process of developing a standard scale that maintains a consistent meaning across test administrations. Reporting scores on such a scale allows users to interpret test scores.

For Alternate ACCESS, a three-digit scale score (910 to 960) was selected to aid in score interpretation. The scale needed an interpretive center point across domains and composites, so the centering value of 935 was chosen to represent the midpoint of the cut score between proficiency levels A3 and P1 for the 3-5 grade-level cluster (see "Creating the Composite Scores" on the next page for more information about the composites). This is analogous to the ACCESS for ELLs scale, where the score of 350 is set as the center value and represents the cut score between proficiency levels P3 and P4 for Grade 5 (for more information see Kenyon, 2006).

Because the test blueprints across grade-level clusters by domain are the same and the Alternate PLs and AMPIs for the test tasks across grade-level clusters pose nearly identical linguistic challenges and differ only in the topics presented, it is desirable to have common cut scores across grade-level clusters by domain. In order to derive these common cut scores, however, test scores from all grade-level clusters need to be placed on a common scale. A common Rasch logit scale was developed to put the task parameters across grade-level clusters on the same scale, allowing test scores from all grade-level clusters to be placed on a common scale. Because the same scoring rules are used to convert students' original responses to raw scores by domain, a single rating scale was modeled across all grade-level clusters by domain. This was achieved by imposing the same threshold parameters across the four grade-level clusters by domain. Through this scaling process, task parameters as well as test scores across grade-level clusters are put on the same scale.

The procedure for developing the reporting scale for Alternate ACCESS was complex, but involved a number of basic steps. These were carried out separately for each domain until the last stage, when the separate domain scales were combined to form the composite scores. These steps, as conducted following the field test administration, are briefly summarized here. For more details about the field test please refer to the *Alternate ACCESS for ELLs Technical Report for Form 100*.

Scaling Design: The measurement model that formed the basis of the Alternate ACCESS scaling analyses was the Rasch Rating Scale Model (Andrich, 1978), as this model is appropriate for polytomously scored test tasks. For the initial Rasch calibration, the Rasch analyses were conducted separately by grade-level cluster and domain; therefore, the parameters for each grade-level cluster and domain were expressed on a unique logit scale. In the later stages of the psychometric analysis, the step or threshold parameters were constrained to be equal across grade-level clusters by domain through an anchoring process in order to put the task parameters across grade-level clusters by domain on the same logit scale. The Grade 3-5 step or threshold parameters were then used as the common step values, primarily because more Grade 3-5 students participated in the field test, therefore producing more stable parameters than other grade-level clusters. For each domain, the Grades 1-2, 6-8, and 9-12 rating scale threshold parameters were anchored to the Grade 3-5 domain values using Winsteps. The difficulty parameters for Grades 1-2, 6-8, and 9-12 were unanchored and thus were calibrated in the runs. All task parameters including the difficulty and threshold parameters were placed on the same logit scale across grade-level clusters by domain through this process. The logit scales were then transformed to the common reporting scale.

Developing the Logit Scale: A calibration of the ability of the students and items using Rasch procedures was applied to the scored student responses, putting the difficulty of the items or tasks and the ability of the students onto one common interval linear scale. The units of this scale are called logits, and by default the scale is usually centered at 0 (representing the average item difficulty for the ACCESS for ELLs items being calibrated). Theoretically, the logit scale runs from minus infinity to plus infinity, although in practice most tests run from about -4 logits to +4 logits.

Transforming the Logit Scale to the Reporting Scale: The logit scale has both negative numbers and decimals, which makes it confusing for many users. Therefore, scores on the logit scale were then transformed onto a reporting scale by means of a linear transformation of the Alternate ACCESS score scale. There is a separate scale for each of the four domains: Listening, Reading, Writing, and Speaking.

Creating the Composite Scores: The scores on the four reporting scales were then combined, in predetermined proportions, to create four composite scores: an Oral Language score (based on performances in Listening and Speaking), a Literacy score (based on performances in Reading and Writing), a Comprehension score (based on performances in Listening and Reading), and an Overall score (based on performances in all four domains).

1.3.4 Standard Setting

The goal of the Standard Setting Study was to interpret performances on the Alternate ACCESS operational field test form in terms of the WIDA ELD Standards, AMPIs, and the WIDA Alternate ELP levels. As discussed in 1.3.3., because the test blueprints across grade-level clusters by domain are the same, and the Alternate ELP levels and AMPIs for the test tasks

across grade-level clusters pose nearly identical linguistic challenges and differ only in the topics presented, common cut scores were set across grade-level clusters by domain. The study was held in Arlington, VA, on October 9-10, 2012.

The *Angoff Yes/No* methodology was used for all four domains because this method is thought to simplify the cognitive tasks that panelists are asked to perform (Cizek & Bunch, 2007). Having a straightforward cognitive task was important in this study as panelists had to examine many tasks to set four cut scores (A1/A2, A2/A3, A3/P1, and P1/P2) across the four domains (Listening, Speaking, Reading, and Writing).

The Angoff Yes/No method was designed for multiple choice and dichotomously scored tasks. This method asks the panelists to consider a student currently functioning at the borderline between two adjacent levels and then to review each question on the test, judging each task as either: a) Yes, the borderline student is more likely than not to meet expectations for this task; or b) No, the borderline student is not more likely than not to meet expectations for this task. Under this method, the average of the panelists' Yes decisions represents an estimated proportion of the target borderline group who would correctly answer the task.

Some modifications were made to the typical *Angoff Yes/No* methodology. First, for the two tasks in Writing Part C, which are scored using a rubric, panelists were shown various writing samples from all score points and asked to make the decision whether *Yes*, the borderline student is more likely than not to have produced this sample, or *No*, the borderline student is not more likely than not to have produced this sample. This approach to addressing the two rubric-scored tasks meant that the same judging procedures that the panelists used on all other tasks could also be used for these two tasks. The second modification was that the *Yes/No* judgment data collected from the panelists was analyzed using a logistic regression procedure to determine cuts. Logistic regression is a statistical technique for relating a continuous variable (i.e., the difficulty of the assessment tasks) to a dichotomous outcome (i.e., the *Yes/No* decisions made by the panelists). This approach was used to avoid limitations in the traditional summation approach of calculating final cut scores with the *Angoff Yes/No* method, which systematically makes lower cuts easier and higher cuts more difficult as compared to the typical Angoff method.

Standards were set on Writing Parts A and B and Speaking using the following procedure. Starting with a student at the lowest borderline within the WIDA Alternate ELP levels (i.e., between A1 and A2), panelists independently indicated whether that borderline student would be more likely than not to meet the expectation for the task. If their decision was *No*, panelists then went on to consider a borderline student at the next higher borderline on that same task (i.e., between A2 and A3). This process was continued, considering students at progressively higher levels of proficiency until they reached the highest borderline OR until they indicated *Yes*, that the borderline student would be more likely than not able to meet expectations for that task.

Once a decision of *Yes* was made, then all higher borderlines would also necessarily be *Yes* and did not need to be individually considered. This aspect of the procedure greatly simplified the panelists' task.

After panelists considered the borderlines for one task, they then examined the next task and began again by considering a student at the lowest borderline. This process continued until panelists had considered all the borderlines on all the tasks. The test tasks were considered in the same order as they are presented in the Alternate ACCESS test booklets. Each panelist completed these evaluations independently. After the first round of evaluations, results for each

task were tallied, allowing the panelists to see the 'average' borderline student (e.g., A2/A3) at which the group had determined the task to be more likely than not be answered correctly.

Writing Part C consisted of two writing tasks that were scored using a five-point rubric ('No Response,' 'Approaches,' 'Meets 1,' 'Meets 2,' and 'Meets 3') and therefore required a slightly different approach. Sample student responses to the two writing tasks were presented to panelists. Panelists were asked to determine whether a student at each borderline would be more likely than not able to have produced each writing sample.

For Listening and Reading, the prompts for the assessment tasks are repeated to students with increasing levels of support, allowing students multiple opportunities to respond. The repeated prompts are labeled as: CUE A: Initial Prompt; CUE B: Simplified Prompt; CUE C: Simplified Prompt & Answer. A response meeting expectations at CUE A (i.e., with minimal support) is interpreted as demonstrating a higher level of proficiency than a response meeting expectations at CUE B, and a response meeting expectations at CUE B exhibits higher proficiency than one at CUE C. For Listening and Reading, the panelists' task was the same as for Writing Parts A and B and Speaking, except that before moving on to the next task they first considered all borderlines on the first task at CUE A, then all borderlines on that task at CUE B, and, finally, all borderlines on that task at CUE C.

For all tasks across all four domains, panelists provided *Yes/No* decisions in a two-round process. In Round 1, panelists independently made their decisions. Staff members then typed the decisions into a specially prepared Excel spreadsheet which tallied the results by the total number of *Yes* and *No* responses. The tallied *Yes/No* decisions across panelists in the group were then revealed to all panelists on a screen with an LCD projector, at which point the panelists had the opportunity to comment on the tallies. Following this discussion, empirical data on student performances on the tasks were presented to the panelists. Using the results from the first round and this new information, the panelists then made a second round of independent *Yes/No* decisions. The Round 2 decisions were again entered and shared with the entire group. A brief opportunity was given to anyone who wanted to comment on the group results before moving on to the next language domain. At the conclusion of the study, researchers used the percentage of *Yes* decisions across panelists from Round 2 to derive the cut scores.

To derive the final cut scores by domain, a series of logistic regression analyses were conducted. A logistic regression analysis was conducted for each cut for each domain (e.g., the A3/P1 cut for Listening) using the panelists' *Yes/No* decisions across test tasks and grade clusters in that domain. The logistic function was used to find the location along the underlying ability continuum at which 50% of the panelists thought that the borderline student is more likely than not to meet the task expectations. This point became the cut point between the two adjacent proficiency levels being analyzed.

For more details regarding the Standard Setting Study, please refer to the *Alternate ACCESS for ELLs Standard Setting Study: Technical Brief* (CAL, 2012a).

1.4 Reporting of Results

1.4.1 Scale Scores

Alternate ACCESS scores are reported as both scale scores and proficiency level scores. Scores are given for all four language domains. In addition, four composite scores are given: Oral

Language (based on performances in Listening and Speaking), Literacy (based on performances in Reading and Writing), Comprehension (based on performances in Listening and Reading), and Overall (based on performances in all four domains).

Raw scores are converted to scale scores through processes called scaling (see section 1.3.3 for details). These processes allow scores to be reported on a standard scale that is familiar to test users and that remains constant across test forms and grade-level clusters. Scale scores range from 910 to 960.

In determining the Oral Language and Literacy composite scores, equal weight is given to each domain. However, in determining the Comprehension and Overall composite scores, more weight is given to literacy skills than to oral skills. The scores are weighted as follows:

Comprehension = 70% Reading + 30% Listening

Overall = 35% Reading + 35% Writing + 15% Listening + 15% Speaking

1.4.2 Language Proficiency Level Scores

In addition to the scale scores, users of Alternate ACCESS also receive proficiency level scores. These scores are *interpretive*; that is, they interpret a student's scale score in terms of the results of the Standard Setting Study. The cut scores between proficiency levels are presented in Table 1.4.2.

Table 1.4.2ACut Scores by Domain and Composite

Domain	A1/A2	A2/A3	A3/P1	P1/P2
Listening	925	932	937	942
Reading	924	932	937	942
Speaking	925	930	939	945
Writing	923	931	938	947
Oral Composite	925	931	938	944
Literacy Composite	924	932	938	945
Comprehension Composite	924	932	937	942
Overall Composite	924	931	938	944

1.5 Test Administration

1.5.1 Test Administrator Training

Test administrators for Alternate ACCESS are required to take the appropriate steps to prepare themselves for test administration. The training steps included reading through the Alternate ACCESS Test Administration Manual (TAM) (WIDA, 2012a) and the Alternate ACCESS Test Administration Tutorial (available on the WIDA website). Test administrators are instructed to internalize the Writing and Speaking rubrics which are essential to consistent scoring across test administrations. For the Writing section, in addition to these materials, the Writing Scoring Guidance document provides sample student papers that help calibrate scoring for the Writing Section.

1.5.2 Test Security

Every effort is made to keep the test secure at all levels of development and administration. CAL and DRC follow policies and procedures regarding the security of the test, and every individual involved in the administration of the test from the district to the classroom level is trained in issues of test security.

1.5.3 Test Accommodations

Alternate ACCESS was designed for a population of students with a wide range of physical and cognitive disabilities. As such, the test design and layout reflect built-in features that aim to provide accessibility and are included as available accommodations on standardized tests for the general population. However, there are many situations where test administrators would need to modify the test administration in order to accommodate student-specific needs. In such cases, the criteria for implementation of any accommodation is determined primarily by the following: guidance in a student's Individual Education Plan (IEP), state accommodation policies, and the WIDA guidelines for appropriate test accommodations specified in the Alternate ACCESS TAM.

1.6 Scoring

All domains (Listening, Reading, Writing and Speaking) are scored locally by test administrators in individual Student Response Booklets. Test administrators must prepare for the scoring of each of the sections by following guidance provided in the TAM. Additional materials for ensuring that test administrators understand the correct scoring guidelines include the Alternate ACCESS Test Administration Video Tutorial and Writing Scoring Guidance document available through the WIDA website at http://www.wida.us/downloadLibrary.aspx. Once a school has finished testing, all test booklets are returned to DRC, where they are electronically scanned and recorded in an electronic database in preparation for data analysis.

1.6.1 Listening and Reading

As with all sections of the Alternate ACCESS test, the Listening and Reading sections are scored by the test administrator. The Listening and Reading tests are identical in administration procedures and consist of selected-response items that provide students with multiple opportunities to demonstrate their knowledge. It is helpful to understand the administration guidelines for the Listening and Reading tasks in order to understand the scoring procedures. The following steps are used to administer each task in the Listening and the Reading sections:

- 1. Administer CUE A (initial prompt and question for the task).
- 2. If the student does not respond, the test administrator must repeat CUE A again, as indicated in the test administrator's script.
- 3. If the student answers incorrectly or does not respond to CUE A, the test administrator will read CUE B. CUE B simplifies the initial prompt and asks the question again.
- 4. If the student responds incorrectly, or does not respond at all after the test administrator reads CUE B, the test administrator will administer CUE C. This cue provides the answer to the question, restates the prompt, and asks the question again.

Based on these administration guidelines for Listening and Reading, a student has a maximum of four opportunities to respond to each task (CUE A – 2, CUE B – 1, CUE C – 1). If a student responds correctly to the task at CUE A (including if the teacher repeated CUE A) the test administrator will score the task as **Correct at CUE A**. If after the two possible attempts at CUE A the test administrator moves on to CUE B and the student answers correctly, they will be scored as **Correct at CUE B**. Likewise, if the student has reached CUE C and answers correctly, they will be scored as **Correct at CUE C**. Finally, if after the four possible chances to answer the task the student has not selected the correct answer, the teacher will mark the task as **Incorrect**. If the student did not respond to any of the four opportunities, the task will be marked as '**No Response**.' Test administrators record all student responses in a Student Response Booklet.

1.6.2 Writing

As mentioned earlier, the Writing section is also scored locally by the test administrator. It is important to understand the design and administration procedures of the Writing test in order to understand the scoring procedures

The Writing section has three thematic folders, Parts A, B, and C.

- Part A of the Writing section has tasks at levels A1- P1.
- Part B of the Writing section has tasks at levels A1 –P1.
- Part C provides the student with tasks at Levels P1 P3; a student is only administered Part C if s/he scores 'Meets' on seven of the eight tasks in Parts A and B.

In Parts A and B of the Writing section, the script is designed for the test administrator to model each task for the student. This provides students the opportunity to observe the test administrator perform the task before trying it. For example, in the first task of the Writing section, the test administrator's script will instruct the test administrator to draw a circle around an image before asking the student to do the same. Similar to the Speaking section, each task in the Writing section provides the student with multiple opportunities for the student to produce a response. If the student produces a response that is appropriate for the task, a score of 'Meets' is assigned, and if the student does not produce a response that meets task expectations, a score of 'Approaches' is assigned. If the student does not respond during the task administration, 'No Response' is assigned to the task. The TAM instructs teachers to score the Writing section using scoring guidance provided in a column of the Writing score sheet termed the 'Expect' box. For each task in Parts A and B, the 'Expect' box provides the test administrator with a description of a response that would meet the task expectations (e.g., copy or write a word related to the task).

The scoring guidelines in the 'Expect' boxes parallel the Writing rubric available in the TAM and the Student Response Booklet. Part C is scored based on the Writing rubric. Student performances can receive a score of 'Meets 1,' 'Meets 2,' 'Meets 3,' 'Approaches,' or 'No Response.' A score of 'Meets' 1, 2 or 3 corresponds to performances described in the Writing rubric for PL 1, 2, or 3. Test administrators are trained to follow the WIDA Consortium's Writing Rubric for Alternate ACCESS and have access to Writing training materials through the WIDA website (www.wida.us). Table 1.6.2A presents the Writing Rubric.

Table 1.6.2AWriting Rubric for Alternate ACCESS

Level	Text Features
3-Developing	One or more simple and expanded sentences. Words in the sentence(s) may be original or adapted from model or source text. Generally comprehensible. Comprehensibility may be impeded from time to time by errors when text becomes more complex. Text is related to the task.
2-Emerging	One or more simple phrases. Text is original or adapted from the model or source text. Comprehensible when text is adapted from model or source text. Comprehensibility may be impeded by errors in original text. Text is related to the task.
1-Entering	One or more general content words. Text is original or adapted from the model or source text. Generally comprehensible when text is adapted from model or source text. Comprehensibility may be significantly impeded in original text. Text is related to the task.
A3-Engaging	Single words and numbers. All or part of text is copied. If original text is present, it is not related to the task. Comprehensibility of the text may be significantly impeded by imprecise letter, symbol, or number formation. Text may or may not be related to the task.
A2-Exploring	Common single-digit numbers, letters, symbols, or syllables. All or part of text is copied. Comprehensibility of the text may be significantly impeded by imprecise letter, symbol, or number formation. Text may or may not be related to the task.
A1-Initiating	Pictorial representations and imprecise, but intentional markings, such as drawings and scribbles. Representations may or may not be related to the task.

1.6.3 Speaking

The Speaking section is also scored by the test administrator. As with other sections of the test, it is helpful to understand the design and administration guidelines for the Speaking section in order to understand the scoring criteria for the Speaking section.

The Speaking section has two thematic folders, Parts A and B. Thematic folders are a set of tasks based on a common setting or story (e.g., students in the library). The graphic(s) and character(s) often remain the same for all the tasks in a thematic folder.

- Part A of the Speaking section has tasks at levels A1 A3.
- Part B of the Speaking section has tasks at levels A1 P2.
- The script for all tasks includes three questions (Question 1, 2, and 3), which offers multiple opportunities for the student to provide a response at a given task level.

In the Speaking section, the student is given up to six opportunities to respond. This provides students with multiple opportunities to respond appropriately to the task in English. For each task, the test administrator reads Question 1 and prompts the student to respond. If the student does not score 'Meets,' the test administrator must repeat the task again. If the student still does not score 'Meets' after the repetition, the test administrator must ask Question 2, which

simplifies the prompt and, in some tasks, models the expected response. If the student again does not score 'Meets,' Question 2 must be repeated. If the student does not score 'Meets' after that repetition, the test administrator must administer Question 3. Again, if the student does not score 'Meets,' this question is repeated once. The possibility of repetition for all three questions provides the student with six opportunities to produce a response in each Speaking task. If the student produces an appropriate response to the task at any point within the six provided opportunities, the task is scored as 'Meets.' If the student is not able at any point to produce a response that meets task expectations, a score of 'Approaches' is assigned. If the student does not make any attempt to respond to the task, a score of 'No Response' is assigned. The TAM instructs teachers to score the Speaking section using scoring guidance provided in a column of the Speaking score sheet termed the 'Expect' box. For each task, the 'Expect' box provides the test administrator with a description of a response that would meet the task expectations (e.g., repeat a word or produce a phrase related to the task). The scoring guidelines in the 'Expect' boxes parallel the Speaking rubric shown in Table 1.6.3A.

Table 1.6.3A Alternate ACCESS Speaking Rubric

Level Speech Features				
Level	•			
	Phrases or short sentences.			
	General language related to the task; groping for vocabulary when going beyond the highly familiar is evident.			
2—Emerging	When using simple discourse, is generally comprehensible and fluent; communication may be impeded by groping for language structures or by phonological, syntactic, or semantic errors when going beyond phrases and short, simple sentences.			
	Single words or chunks of memorized oral language.			
	General vocabulary from school setting and related to task.			
1—Entering	When using memorized language, is generally comprehensible; communication may be significantly impeded when going beyond the highly familiar.			
	Single words or chunks of mimicked oral language.			
	Mimicked high frequency vocabulary words related to the task.			
A3—Engaging	When using mimicked language, is generally comprehensible; communication may be significantly impeded when going beyond mimicked language.			
	Single syllables or syllables of single words; speech is mimicked.			
A2—Exploring	Mimicked sounds and syllables of high frequency vocabulary words related to the task.			
	Language is minimal.			
A1 Initiating	Communicative vocalizations, which may be imitated (e.g., grunts).			
A1—Initiating	Indiscriminant sounds and syllables.			

2. An Assessment Use Argument for Alternate ACCESS for ELLs: Focus on Assessment Records

Validity is "the degree to which evidence and theory support the interpretations of test scores for proposed uses of tests" (American Educational Research Association, American Psychological Association, & National Council on Measurement in Education [AERA, APA, & NCME], 2014, p. 11). Evaluations of test validity assess whether there is evidence that supports the appropriateness and adequacy of the interpretations and decisions made about test takers on the basis of their performance on a test. This chapter contextualizes the information presented in this Annual Technical Report within an argument-based approach to addressing validity (Bachman & Palmer, 2010; Chapelle, Enright, & Jamieson, 2008; Kane, 2002, 2013; Mislevy, Almond, & Lukas, 2004) for Alternate ACCESS for ELLs.

A fully developed validation framework, including an Assessment Use Argument (AUA) (Bachman & Palmer, 2010), consists of several steps (described in Section 2.1 below) that connect test design and administration to intended and actual score interpretation and consequences. This chapter begins the process of developing a complete validation framework for Alternate ACCESS for ELLs. This argument-based structure organizes the information in this Annual Technical Report to support claims about Assessment Records (i.e., test scores and proficiency level descriptions collected via Alternate ACCESS for ELLs). Specifically, tables and figures from this report are explicitly linked to questions related assessment data. Chapelle, Enright, & Jamieson (2010) support using such a structure to present information to assessment users because "based on an analysis of four points of comparison—framing the intended score interpretation, outlining the essential research, structuring research results into a validity argument, and challenging the validity argument—we conclude that an argument-based approach to validity introduces some new and useful concepts and practices" (p.3). A larger, though yet undocumented (as of 2014), validity argument for the complete assessment from its inception to its consequences is currently under development by WIDA.

The complete validity argument that will be employed to support the use of Alternate ACCESS for ELLs will show the path from test design to test taker performance to the uses and interpretations of test scores and the subsequent consequences of test use. This framework is structured around assertions, or claims, about the assessment. The claims are presented as a series of statements that connect some aspect of the assessment process to the intended purposes of the assessment. Evidence for each claim is then organized by the action that is used to ensure each claim, and it includes results from analyses of test data, outside documentation, and other resources. In the complete validation argument, this process of identifying evidence to support claims will encompass the entire testing process, from the commencement of the test design to the consequences of test use (Bachman & Palmer, 2010; Llosa, 2008); Figure 2A shows the process by which evidence supports validation actions, which are used to establish larger claims about Alternate ACCESS for ELLs.

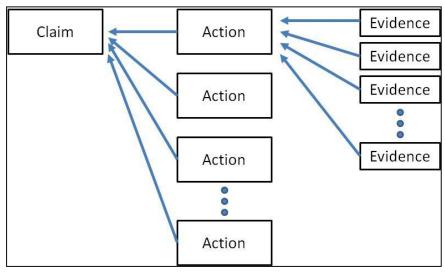

Figure 2A: General Argument Structure for Assessment Validation

2.1 The Generic Validation Framework for Alternate ACCESS

The generic validation framework that will be applied to the entire Alternate ACCESS for ELLs testing process was developed at the Center for Applied Linguistics (CAL) and is hereafter referred to as CAL's Validation Framework. CAL's Validation Framework, shown in Figure 2.1A, combines models for both test development (i.e., Evidence-Centered Design [Mislevy, Almond, & Lukas, 2004]) and assessment validation (i.e., Bachman and Palmer's (2010) AUA) to cover the assessment development and implementation process from initial conceptualization to the score interpretations and consequences of using the assessment. This framework constantly looks both forward and backward; for example, during the initial *Plan* step (Step 7), test developers state the anticipated decisions and consequences of implementing the assessment program, which are investigated in the *Decisions* step (Step 2) and *Consequences* step (Step 1). Because each subsequent step depends upon the strength of the step below it, the steps are numbered from 7 to 1, with *Consequences* being the culmination of the previous steps. This structure highlights the fact that any weakness in a lower step affects the steps above it.

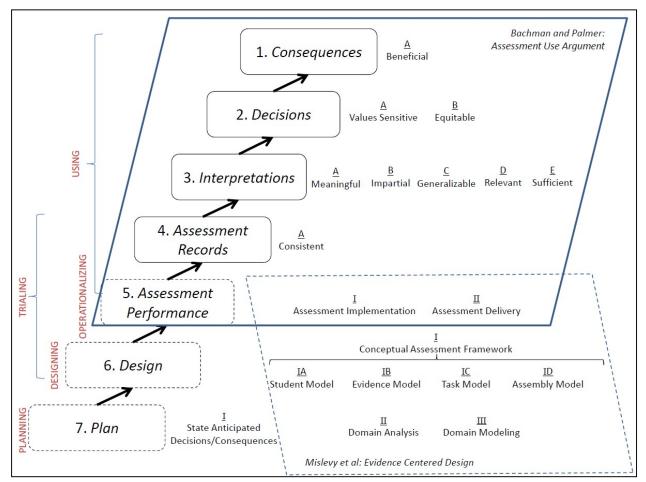

Figure 2.1A: CAL's Validation Framework (based on Bachman & Palmer, 2010; Mislevy, Almond, & Lukas, 2004)

In CAL's Validation Framework, the *Plan* step involves an examination of possible decisions states might make and consequences that might result from the assessment. This leads to the consideration of several models during the *Design* step, where specifications that answer such critical questions as "What are we measuring?" and "How do we measure it?" are developed (Mislevy, Almond, & Lukas, 2004). The subsequent steps of the validation framework highlight the trialing, implementation, and use of the assessment results, beginning with test takers' performance on the assessment (*Assessment Performance*) and continuing through the collection of test scores (*Assessment Records*), interpretations of those test scores (*Interpretations*), decisions made based on the test scores (*Decisions*), and the consequences of test use (*Consequences*).

The WIDA Consortium is using CAL's Validation Framework to present a complete validity argument, which will be updated as needed, for Alternate ACCESS for ELLs. To date, information related to Step 4, Assessment Records, has been explored and is found in this chapter.

2.2 Focus on Assessment Records

Although the complete validation framework for Alternate ACCESS for ELLs contains seven steps (see Figure 2.1A), the data presented in this document cover the Assessment Records step, which is part of Bachman and Palmer's (2010) AUA. By focusing on Assessment Records (i.e., test scores and proficiency level descriptions), the information in the Annual Technical Report will be used to support claims related to the quality and consistency of the assessment data gathered and analyzed using Alternate ACCESS for ELLs. The claims in this step of the AUA all pertain to the general question "How do we know that the reported language domain scores and composite scores on Alternate ACCESS for ELLs are consistent and dependable?" Other questions about the development, administration, and outcomes of Alternate ACCESS for ELLs will be evaluated in a forthcoming document, currently in development by WIDA.

The diagram in Figure 2.2A shows a visual representation of an argument-based approach for supporting claims related to Assessment Records. The figure shows how the Assessment Records step, Step 4 of the complete validation framework, will fit in the generic validation framework and be expanded into a series of claims and corresponding actions in this chapter of the Annual Technical Report. Evidence in the form of data from this report or other sources will be presented to support these claims as they relate to ACCESS for ELLs.

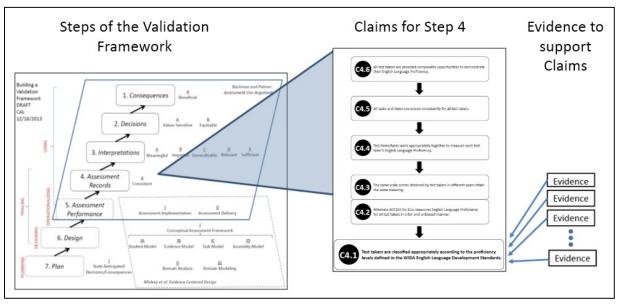

Figure 2.2A: Structure of the Argument-Based Approach Supporting Step 4 Contained in this Chapter

2.2.1 Breakdown of Claims for the *Assessment Records* Produced in the Alternate ACCESS for ELLs Assessment Program

The general *Assessment Records* step, Step 4 of the full Alternate ACCESS for ELLs validation framework, is broken down into the following six claims:

- C4.6. All test takers are provided comparable opportunities to demonstrate their English Language Proficiency.
- C4.5. All tasks and items are scored consistently for all test takers.
- C4.4. Test items/tasks work appropriately together to measure each test taker's English Language Proficiency.
- C4.3. The same scale scores obtained by test takers in different years retain the same meaning.
- C4.2. Alternate ACCESS for ELLs measures English Language Proficiency for all test takers in a fair and unbiased manner.
- C4.1. Test takers are classified appropriately according to the Alternate English Proficiency Levels defined in the WIDA English Language Development Standards.

As shown in Figure 2.2.1A, these claims depend upon each other, again moving from (4.6) up to (4.1). Within this organizational structure, each successive claim builds upon the previous one(s) (e.g., ratings are only useful to test developers and stakeholders if all test takers are provided comparable opportunities to demonstrate their proficiency). In the next section, these claims are broken down even further into actions that are taken to ensure the consistency and reliability of the assessment records.

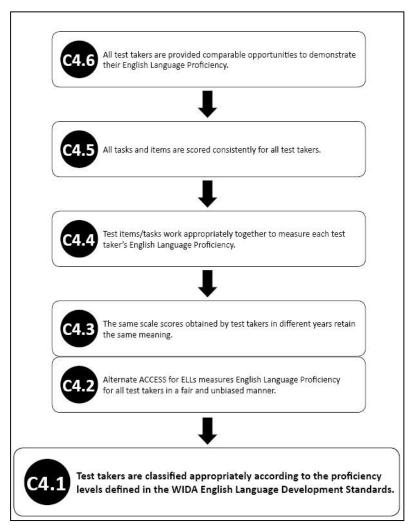

Figure 2.2.1A: Progression of Claims for Step 4: Assessment Records

2.3 Evidence for Assessment Records Claims of Alternate ACCESS for ELLs

In this section, evidence in the form of data or other sources (e.g., Test Administration Manuals, the technical brief of the Alternate ACCESS for ELLs standard setting study, the technical brief of the Alternate ACCESS for ELLs Series 100 development and operational field Test, and other information within this report, etc.) is connected to each of the *Assessment Records* claims via the actions taken to ensure those claims. This section denotes the tables, figures, and external sources that provide evidence related to each action. A summary table of the information presented in this section, including hyperlinks to the detailed description of each table or figure in Chapter 5 of this Annual Technical Report, is contained in Section 2.4. Information on how to navigate the tables and figures throughout this report is presented in Section 2.5.

Because these claims relate to Step 4 of the overall validation framework, their numbering begins with 4. The second number (after the decimal) denotes the level of the claim within Step 4. This numbering system is used in anticipation of the development of more complete documentation of a validity argument for Alternate ACCESS for ELLs, which will be completed by WIDA. Individual

actions to ensure each claim are denoted by the final letter (a, b, c, and so on).

Claim 4.6 - All test takers are provided comparable opportunities to demonstrate their English Language Proficiency.

<u>Action 4.6.a:</u> The students that take Alternate ACCESS for ELLs have been identified as English language learners and participate in an alternate curriculum that aligns with the test.

<u>Evidence</u>: Exclusionary criteria and participation guidelines are closely followed by local test administrators (see Table 4.10.1 Participation by Disability, S103).

Action 4.6b: All test takers are given equal opportunities to demonstrate their English language proficiency.

<u>Evidence</u>: The Test Administration Manual provides clear guidance on the use of supporting features of Alternate ACCESS for ELLs, including repetition of questions, availability of cues, etc. (WIDA, 2013). If necessary, further accommodations for test takers are taken following the principles in the test administration manual.

<u>Action 4.6c</u>: Well-specified procedures were developed for test administrators so that they are able to administer the test consistently.

<u>Evidence</u>: Procedures for administering the test, stopping the test, and producing reported scores are documented in the Alternate ACCESS for ELLs Test Administration Manual (WIDA, 2013).

Action 4.6d: Test administrators document and report any irregularities that may occur so that appropriate action may be taken.

<u>Evidence</u>: Alternate ACCESS student response booklets contain a section for reporting irregular cases, such as invalid administration, absent student, or declined assessment. Test administration procedures are documented in the Alternate ACCESS for ELLs Test Administration Manual (WIDA, 2013).

Claim 4.5 – All items and tasks are scored consistently for all test takers.

Action 4.5a: A clear scoring design facilitates the task rating process for Test Administrators.

Evidence: The scoring procedures are clearly stated in the test administrator's script and the Student Response Booklet is designed to match the scoring procedures and to avoid any scoring ambiguity.

Action 4.5b: Test Administrators undergo training so that they know how to score appropriately.

Evidence: Section 1.6 of this report specifies the scoring procedure for Alternate ACCESS for ELLs. Since all sections of Alternate ACCESS are scored locally, Test Administrators are provided with adequate training materials through an online program on the WIDA website to make sure they follow the test administration script and scoring rubrics for the Speaking and Writing sections. The scoring rubrics for Speaking and Writing are in the Test Administration Manual (WIDA, 2013).

Claim 4.4 - Test items/tasks work appropriately together to measure each test taker's English Language Proficiency.

<u>Action 4.4a</u>: For each *test form* (e.g., Reading 6–8), item and task analyses are performed and psychometric properties of the items and tasks are evaluated to confirm that scores are internally consistent.

<u>Evidence</u>: Reliability information based on Classical Test Theory is calculated for each test form. This information includes Cronbach's alpha, which is a measure of internal consistency.

Cronbach's coefficient alpha is widely used as an estimate of reliability and expresses how well the items on a test appear to work together to measure the same construct (see Table 6E).

<u>Action 4.4b</u>: For each *domain and composite score*, item and task analyses are performed and psychometric properties of the items and tasks are evaluated to confirm that scores are internally consistent.

<u>Evidence</u>: A single reliability estimate, a stratified Cronbach's alpha (Cronbach, Schonemann, & McKie, 1965), is calculated by grade-level cluster for each domain and composite score.

Cronbach's alpha indicates the extent to which test items are consistent with each other. The stratified Cronbach's alpha is an average reliability, and it is used when test takers are administered several related subtests but are then evaluated based on a composite of those subtest scores. Table 6E presents the data used to calculate an estimate of the reliability of the composite scores using a stratified Cronbach's alpha.

Action 4.4c: Analyses of Rasch model fit statistics are conducted to show that individual tasks perform appropriately.

Evidence: The Complete Items Analysis table includes information on the Rasch fit statistics for each test item (see Table 6G). These statistics, called outfit mean square and infit mean square statistics, measure how well an item is measuring the same construct as other items on the test. Infit and outfit statistics indicate any consistently unusual performance in relation to the item's difficulty measure by measuring the degree to which examinees' responses to items deviate from expected responses. Both statistics have an expected value of 1.0. Items with infit and outfit mean square statistics between 0.5 and 1.5 are considered "productive for measurement" (Linacre, 2002). Values between 1.5 and 2.0 are "unproductive for construction of measurement, but not degrading." Values greater than 2.0 might "distort or degrade the measurement system." Values below 0.5 are "less productive for measurement, but not degrading." Infit helps ensure that test takers within range of the targeted proficiency level perform as expected. It is not as sensitive to outliers as Outfit. Outfit can be skewed if test takers with extreme (i.e., high-level or low-level) proficiency do not perform as expected. High infit is a bigger threat to validity, but is more difficult to explain than high outfit (Linacre, 2002). The infit and outfit mean square statistics are part of the evaluation criteria used to select the items and tasks that appear on the final operational forms. Alternate ACCESS for ELLs test items with infit or outfit values between 1.2 and 1.3 are reviewed and items with values greater than 1.3 are not used on operational forms of the test.

Claim 4.3 - The same scale scores obtained by test takers in different years retain the same meaning.

Action 4.3a: All test items and tasks have been field tested and anchored using items from the operational field test (Series 100) to maintain a consistent scale from year to year.

<u>Evidence</u>: These retained "anchor items" ensure that performances on the newer form may be interpreted in the same frame of reference as the previous year. Table 6G displays information on the anchor items for each test form.

<u>Action 4.3h</u>: The same scaling equation is applied from year to year to ensure that scale scores are obtained consistently over time.

<u>Evidence</u>: The scaling equation table is used to convert a test taker's ability measure, which is calculated based on test performance using Rasch modeling, into an Alternate ACCESS for ELLs scale score (see Table 6H). The same equation is used across grade-level clusters within each domain.

Claim 4.2 – Alternate ACCESS for ELLs measures English Language Proficiency for all test takers in a fair and unbiased manner.

<u>Action 4.2a</u>: Differential Item Functioning (DIF) analyses are conducted to determine whether any items or tasks may be biased against certain subgroups in terms of gender and ethinicity.

<u>Evidence</u>: The Item Analysis Summary provides a summary of the findings of the differential item functioning (DIF) analyses, which look for measurement bias in test items (see Table 6F). Analyses search for bias in contrasting groups based on gender (male versus female) and ethnicity (Hispanic versus non-Hispanic). This table shows the number of items that favored one group or the other at all levels of DIF.

The Complete Items Analysis table includes more detailed information on the DIF analyses, showing the degree of measurement bias for each item and which group is favored (Table 6G). Each item is categorized into three levels of DIF: A, B, or C (Zieky, 1993). An item exhibiting A level DIF shows little or no evidence of bias toward a particular group, an item exhibiting B level DIF is displays a moderate amount of bias, and an item exhibiting C level DIF is considered to display considerable evidence for potential bias and should be closely examined by test developers to identify any construct irrelevent factors that may contribute to DIF.

<u>Action 4.2b</u>: Items that show evidence of DIF are carefully reviewed so that any that indicate bias are not used for scoring and are removed from future test forms.

<u>Evidence</u>: As described in Chapter 5.1.4 (DIF Items), ethnicity and gender DIF analyses are conducted using all test taker data.

Claim 4.1 - Test takers are classified appropriately according to the Alternate proficiency levels defined in the WIDA English Language Development Standards.

<u>Action 4.1a</u>: Distributions of scale scores and proficiency levels for each domain are analyzed to confirm that Alternate ACCESS for ELLs effectively measures the performance of test takers across the range of Alternate English Language Proficiency levels as defined by the WIDA English Language Development (ELD) Standards.

<u>Evidence</u>: The distribution of test takers' raw scores on Alternate ACCESS for ELLs, organized by individual test form (e.g., Reading 3–5), shows the extent to which Alternate ACCESS for ELLs effectively measures the performance of test takers across the range of ELD abilities that each form was designed to assess (see Table 6A; see Figure 6A).

The distribution of test takers' scale scores on Alternate ACCESS for ELLs, organized by test form (e.g., Reading 3–5), shows that Alternate ACCESS for ELLs effectively measures the performance of test takers across the range of ELD abilities that each form was designed to assess (see Table 6B; see Figure 6B).

The proficiency level distribution of test takers' scores on Alternate ACCESS for ELLs, organized by individual test form (e.g., Reading 3–5), shows that Alternate ACCESS for ELLs effectively measures the performance of test takers across the range of proficiency levels that each form was designed to assess (see Table 6C; see Figure 6C).

The Raw Score to Proficiency Level Score table shows the interpretive proficiency level score associated with each raw score (see Table 6I). This distribution of scores shows that Alternate ACCESS for ELLs effectively measures the performance of test takers across the range of proficiency levels that each form was designed to assess.

The Test Characteristic Curve for each test form graphically shows the relationship between test takers' ability measure (which is calculated based on test performance using Rasch modeling) on the horizontal axis and the expected raw scores on the vertical axis (see Figure 6D). Four vertical lines indicate the four cut scores for the highest grade in the cluster, dividing the figure into five sections for each of the five WIDA proficiency levels. The curve shows that higher expected raw scores are required to be placed into higher language proficiency levels.

<u>Action 4.1b</u>: Distributions of scale scores and proficiency levels, organized by grade-level cluster, are analyzed to confirm that Alternate ACCESS for ELLs effectively measures the performance of test takers across the range of Alternate English Language Proficiency levels as defined by the WIDA ELD Standards.

<u>Evidence</u>: The distribution of test takers' scale scores on Alternate ACCESS for ELLs, organized by grade-level cluster, shows that Alternate ACCESS for ELLs effectively measures the performance of test takers across the range of abilities as described by the WIDA ELD Standards (see Table 6B; see Figure 6B).

The proficiency level distribution of test takers' scores on Alternate ACCESS for ELLs, organized by grade-level cluster, shows that Alternate ACCESS for ELLs effectively measures the performance of test takers across the range of Alternate proficiency levels as defined by the WIDA ELD Standards (see Table 6C; see Figure 6C).

The Test Characteristic Curve reflects test takers' mean raw scores by domain on Alternate ACCESS for ELLs across the entire test for each grade-level cluster (except for the Kindergarten

level) (see Figure 6D).

Action 4.1c: For each test form, analyses are run to confirm that English Language Proficiency is measured with high precision at the cut points.

<u>Evidence</u>: The Test Information Function graphically shows how well the test is measuring across the ability measure spectrum, which is calculated based on test performance using Rasch modeling (see Figure 6E). High values indicate more accuracy in measurement.

In the Raw Score to Proficiency Level Conversion Chart, the proficiency level associated with each raw score shows the distribution of proficiency level scores associated with each raw score for each grade in the cluster, along with the percentage of test takers in that grade who scored at that raw score/proficiency level score (see Table 6I). The Raw Score to Scale Score Conversion Chart (Table 6H) presents the conditional standard error for each scale score, along with the upper and lower bound of the scale scores within this standard error of measurement. This value indicates how accurately or precisely the test is measuring test takers at a particular ability level by estimating the error measurement at each score point. Because there is usually more information about test takers with scores in the middle of the score distribution on each form, the conditional standard error values are usually smallest and scores are more reliable in that region of the score distribution.

Action 4.1d: Classification and accuracy analyses are conducted by grade level to confirm that proficiency level classifications are reliable for all domain and composite scores.

Evidence: Information related to the accuracy of test takers' proficiency-level classifications is presented in multiple ways (see Table 6J). A separate table is provided for each grade level in a cluster. The table provides overall indices related to the accuracy and consistency of classification. These indices indicate the percent of all test takers who would be classified into the same language proficiency level by both the administered test and either the true score distribution (accuracy) or a parallel test (consistency). Cohen's kappa, which is a statistical measure of interrater agreement between two raters that takes chance agreement between raters into account, is also presented. A kappa value of 1 indicates complete agreement between the two raters, while a kappa value of 0 indicates no agreement other than what would be expected by chance. Table 6J also shows accuracy and consistency information conditional on level and provides indices of classification accuracy and consistency at the cut points.

2.4 Summary of Assessment Records Claims, Actions, and Evidence

Table 2.4ASummary of Assessment Records Claims, Actions, and Evidence

Claim	Actions	Evidence
6. All test takers are provided comparable opportunities to demonstrate their English Language	a. The students that take Alternate ACCESS have been identified as English language learners and participate in an alternate curriculum that aligns with the test.	a. b. Chapter 5.1.4 (DIF Items)

- 1. Test takers are classified appropriately according to the Alternate proficiency levels defined in the WIDA English Language Development (ELD) Standards.
- a. Distributions of scale scores and proficiency levels for each domain are analyzed to confirm that Alternate ACCESS for ELLs effectively measures the performance of test takers across the range of Alternate English Language Proficiency levels as defined by the WIDA ELD Standards
- a. Figure 6A (Raw Scores) & Table 6A (Raw Score Descriptive Statistics); Figure 6B (Scale Scores) & Table 6B (Scale Score Descriptive Statistics); Figure 6C (Proficiency Level) & Table 6C (Proficiency Level Distribution); Table 6I (Raw Score to Proficiency Level Score Conversion Chart); Figure 6D (Test Characteristic Curve)
- b. Distributions of scale scores and proficiency levels, organized by grade-level cluster, are analyzed to confirm that Alternate ACCESS for ELLs effectively measures the performance of test takers across the range of Alternate English Language Proficiency levels as defined by the WIDA ELD Standards.
- c. For each test form, analyses are run to confirm that English Language Proficiency is measured with high precision at the pertinent cut points.
- d. Classification and accuracy analyses are conducted by grade-level to confirm that proficiency level classifications are reliable for all domain and composite scores.
- b. Figure 6B (Scale Scores) & Table 6B (Scale Score Descriptive Statistics); Figure 6C (Proficiency Level) & Table 6C (Proficiency Level Distribution); Figure 6D (Test Characteristic Curve)
- c. Figure 6E (Test Information Function); Table 6H (*Raw Score to Scale Score Conversion Chart*)
- d. Table 6J (Accuracy and Consistency of Classification Indices)

2.5 Visual Guide to Tables and Figures

This section provides navigational support for the tables and figures contained in the Alternate ACCESS for ELLs Annual Technical Report. The Visual Guide to Tables and Figures, shown in Figures 2.5.1 and 2.5.2, serves as a resource to quickly identify which table and/or figure to look for when seeking specific information based on grade, grade-level cluster, and demographic characteristics, such as state, gender, disability type, and ethnicity and race, as well as domains and domain composites.

To use the Visual Guide to Tables and Figures as a navigational tool, click on the links in Figures 2.5.1 through 2.5.3 to navigate to the selected tables and figures in the Annual Technical Report. A link is provided at the end of each section in Chapters 4 and 6. Detailed descriptions of the information in each of the tables and figures is included in the preceding chapters (e.g., Chapter 5 contains information on tables and figures in Chapter 6). These descriptions may be accessed through links in Table 2.4A Summary of Assessment Records Claims, Actions, and Evidence.

Figure 2.5.1 displays the tables in Chapter 4 that provide information on participation, scale score, and proficiency level results, as well as results by standard. The key in the upper left corner of the figure describes the tables contained in each section of the chapter. For example, tables in Section 4.1 contain information about participation. To find specific information in Chapter 4, select the Grade or Grade Cluster tab, and then the Domain tab, and then choose from three categories: Demographic Characteristics, Domain Composites, or Domains. Within each of these categories, several additional options organize information so that individual tables can be accessed. For example, to find a table that displays information on the number of female Grade 2 students who completed the Speaking section, refer to Figure 2.5.1 and complete the following steps: one, select Grade; two, select Domains; three, select Demographic Characteristics; four, select Gender. The information is found in Table 4.2.2.2. Click on 4.2.2.2 to go to the appropriate table in Chapter 4.

Figure 2.5.2 displays the sections in Chapter 6 that contains analyses for each Alternate ACCESS for ELLs test form by grade-level cluster and domain. The key above the figure describes specific information in each table and figure. For example, to find the Reliability table for Grade-level Cluster 9–12 in the Reading domain, refer to Figure 2.5.2 and complete the following steps: one, select Grade Cluster 9–12; two, select; three, select Reading under Domains. Information for 9–12 Reading is shown in section 6.5.2.3. Finally, look at the key that explains that reliability information is located in table F. The result is Table 6.5.2.3F. Click on 6.5.2.3 to go to the appropriate section, and then locate Table F.

Table H	Raw Score to Scale Score Conversion
Table I	Raw Score to Proficiency Level Conversion
Table J	Accuracy and Consistency of Classification Indices

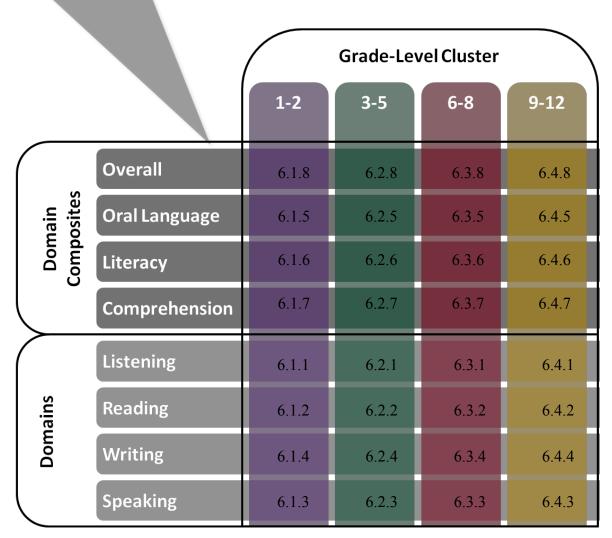

Figure 2.5.2 Chapter 6 Visual Guide to Tables and Figures

3. Descriptions of Student Results

Chapter 3 provides a description of the Chapter 4 tables summarizing students' participation, scale scores, and proficiency levels; results are further subdivided by grade, grade-level cluster, state, domain, domain and composite scores, gender, ethnicity/race, and disability. Of the 38 WIDA Consortium states, 38 participated in the 2015-2016 Alternate ACCESS operational administration.

3.1 Participation

Table 4.1.1–Students Excluded from Analysis

In some circumstances there was a mismatch between a student's reported grade and the grade-level cluster (i.e., 1-2, 3-5, 6-8, or 9-12) actually administered (e.g., a student reported to be in Grade 1 who was administered a test intended for students in the 3-5 grade-level cluster). In all, 65 students were administered a test form not intended for their grade-level cluster. See Table 4.1.1 for a breakdown of the incorrect test forms assigned, by grade. The data from these 65 students were eliminated from all subsequent analyses in this report.

Section 4.2-Grade-Level Cluster, Gender, Ethnicity

Section 4.2 provides a breakdown of participation by grade-level cluster as a function of state (Table 4.2.1), gender (Table 4.2.2) and ethnicity (Table 4.2.3). For each of the 38 WIDA states who participated in the 2015-2016 operational testing program, Table 4.2.1 provides the number of test takers by grade-level cluster as well as total counts by state (final column) and grade-level cluster across all states (final row). For each grade-level cluster, Table 4.2.2 provides the distribution of test takers by gender (Female, Male, or Missing). Table 4.2.3 provides a similar breakdown of grade-level cluster by ethnicity (Hispanic or Non-Hispanic).

Section 4.3–Grade, Gender, Ethnicity

Section 4.3 duplicates the information provided by Section 4.2, but further breaks down the distribution of test takers by grade (Grades 1 to 12), instead of grade-level cluster. For each state, Table 4.3.1 provides the distribution of test takers by grade; for each grade, Table 4.3.2 provides the distribution of test takers by gender; for each grade, Table 4.3.3 provides the distribution of test takers by ethnicity.

Section 4.4–Domain, Grade-Level Cluster, Grade

Section 4.4 provides a breakdown of test taker counts by domain (Listening, Reading, Speaking, and Writing), with Table 4.4.1 summarizing the distribution by grade-level cluster and Table 4.4.2 summarizing the distribution by grade.

3.2 Scale Score Results

3.2.1 Mean Scale Scores Across Domain and Composite Scores

Overview of Sections 4.5 - 4.7

Sections 4.5 through 4.7 display the mean scale scores (Mean), standard deviation (Std. Dev.) and counts (N) by *grade and/or grade-level cluster* across the eight scores awarded on Alternate ACCESS for ELLs, first for each of the four domains (Listening, Reading, Speaking, and

Writing) and then for each of the four composites (Oral Language, Literacy, Comprehension, and Overall). Sections 4.6 and 4.7 include gender and ethnicity information.

Section 4.5–Grade and Grade-Level Cluster

For each of the four grade-level clusters, Tables 4.5.1A through 4.5.1D display the mean scale scores for each domain and composite — first separately by grades within each cluster and then by the grade-level cluster overall (as the final column).

Section 4.6–Grade-Level Cluster, Gender, Ethnicity and Race

For each of the four grade-level clusters, Tables 4.6.1A through 4.6.1D display the mean scale scores for each domain and composite by gender. Correspondingly, Tables 4.6.2A through

4.6.2.D provide the mean scale score information by ethnicity and race. (Note that for the 4.6.1 Table series Domain is the row variable, and for the 4.6.2 table series Domain is the column variable.)

Section 4.7-Grade, Gender, Ethnicity and Race

For each of the 12 grades, Tables 4.7.1A through 4.7.1L display the mean scale scores for each domain and composite. Correspondingly, Tables 4.7.2.A through 4.7.2L display the mean scale scores by ethnicity and race.

3.2.2 Correlations

For each of the four grade-level clusters, Tables 4.8.1 through 4.8.4 display the Pearson correlations between scale scores on the four domains.

3.3 Proficiency Level Results

Section 3.3, Proficiency Level Results, displays the distribution of students' language proficiency level³ by grade-level cluster (Tables 4.9.1A-H) and grade (Tables 4.9.2A-H), with each sub-table presenting results by domain/composite:

- A Listening
- B Reading
- C Speaking
- D Writing
- E Oral Language Composite F Literacy Composite
- G Comprehension Composite H Overall Composite

³ The WIDA Alternate ELD Standards has six levels (A1-A3; P1; P2; P3). P3 was not part of the current analysis.

3.4 Participation by Disability

Table 4.10.1 displays the distribution of test takers as function of primary and secondary disability, each with 14 categories:

- No Primary/Secondary Disability (NPD/NSD)
- Autism (AUT)
- Cognitive Disability (CD)
- Deaf/Blind (D/B)
- Emotional Behavioral Disability (EBD)
- Deaf/Hard of Hearing (D/HH)
- Other Health Impairment (OHI)
- Orthopedic Impairment (OI)
- Significant Developmental Delay (SDD)
- Specific Learning Disability (SLD)
- Speech and Language Disability (S/L)
- Traumatic Brain Injury (TBI)
- Blind/Visually Impaired (B/VI)
- Multiple Disabilities (MD)

The accompanying *Acronyms for Table 4.10.1* table matches each disability category with its acronym to aid in interpretation.

5. Analyses of Test Forms: Overview

This chapter contains two parts. The first part provides some background on the technical measurement and statistical tools used to analyze Alternate ACCESS for ELLs. The second part explains the results that are presented for each test form in Chapter 6.

5.1 **Background**

5.1.1 **Measurement Models Used**

The measurement model that forms the basis of the analysis for the development of Alternate ACCESS for ELLs is the Rasch measurement model (Wright and Stone, 1979). Additional information on its use in the development of the test is available in WIDA Technical Report 1, Alternate ACCESS for ELLs TM, Series 100 Development and Operational Field Test: Technical Report. The test was developed using Rasch measurement principles, and in that sense the Rasch model guided all decisions throughout the development of the assessment and was not just a tool for the statistical analysis of the data. For example, data based on Rasch fit statistics guided the inclusion, revision, or deletion of items during the development and field testing of the test forms and will continue to guide the refinement and further development of the test.

For all domains, a Rasch Rating Scale model was used. Mathematically, this can be represented as

$$\log(\frac{P_{nik}}{P_{nik-l}}) = B_n - D_i - F_k \qquad , \text{ where}$$

 $\log(\frac{P_{nik}}{P_{nik-1}}) = B_n - D_i - F_k \qquad \text{, where}$ $P_{nik} = \text{probability of person "n" on task "i" receiving a rating at level "k" on the rating scale}$

 P_{nik-1} = probability of person "n" on task "i" receiving a rating at level "k - 1" on the rating scale (i.e., the next lowest rating)

 B_n = ability of person "n"

 D_i = difficulty of task "i"

 F_k = calibration of step "k" on the rating scale

All Rasch analyses were conducted using the Rasch measurement software program *Winsteps* (Linacre, 2006). When speaking of the measure of examinee ability, we use the term "ability measure" (rather than theta, which is used commonly when discussing models based on Item Response Theory [IRT]). When speaking of the measure of how hard an item was, we use the term "item difficulty measure" (rather than the term b parameter, which is used commonly when discussing models based on IRT). "Step measures" refer to the calibration of the steps in the Rasch Rating Scale model presented above. All three measures (ability, difficulty, and step) are expressed in terms of Rasch logits, which then are converted into scores on the Alternate ACCESS for ELLs score scale for reporting purposes (see WIDA Technical Report 1 for more details).

Rasch model standard errors also appear in the tables. These are an indication of the precision with which the measures have been estimated. Unlike the standard error of measurement (SEM) based on classical test theory, which posits the same SEM for all persons regardless of theirposition on the ability distribution, Rasch model standard errors are conditional on the individual's ability measure. All things being equal, if a person gets few items correct or few

items incorrect, the standard error of that person's measure will be greater than if a person gets a moderate number of items correct. In addition, for ability measures, standard errors are a function of the number of items on a test form as well as the distribution and quality of the items (i.e., their fit to the Rasch model).

Fit statistics for the Rasch model are provided in Chapter 6. These statistics are calculated by comparing the observed empirical data with the data that would be expected to be produced by the Rasch model. Of the several statistics available, the mean square fit statistics were used to flag items in the development of Alternate ACCESS for ELLs that needed to be deleted or revised. Outfit mean square statistics are more sensitive to outliers. For example, a difficult item that some low ability examinees get correct will have a high outfit mean square statistic that indicates that the item may not be measuring the same thing as other items on the test. Infit mean square statistics are influenced by more aberrant response patterns and generally indicate a more serious measurement problem. The expectation for both of these statistics is 1.00 and values near

1.00 are not of great concern. Values less than 1.00 indicate that the observations are too predictable and thus redundant, but are not of great concern. High values are more of a concern.

According to Linacre (2002):

values greater than 2.0 "distort or degrade the measurement system"

values between 1.5 and 2.0 are "unproductive for construction of measurement, but not degrading"

values between 0.5 and 1.5 should be considered "productive for measurement" values below 0.5 are considered "less productive for measurement, but not degrading"

Because conservative guidelines were followed in the development of Alternate ACCESS for ELLs, the vast majority of items and tasks on the test forms have mean square fit statistics in the range of 0.75 and 1.25 and therefore fall within the range that is "productive for measurement" according to the guidelines above.

5.1.2 Sampling

The results presented in most of the tables in Chapter 6 are based on the full data set of all students who were administered operational Series 101 of Alternate ACCESS for ELLs in the academic year 2012-2013. The item analysis summary tables (Table F), the complete item analysis tables (Table G), and the raw score to scale score conversion tables (Table H) use item difficulties from this calibration

5.1.3 Scaling

Complete information on the horizontal and vertical scaling of Alternate ACCESS for ELLs scores is provided in Technical Report 1, *Alternate Access for ELLs* **Series 100 Development and Operational Field Test: Technical Report. In brief, this scaling was accomplished during the field test based on an elaborate common item design, across grade-level clusters, which spanned two series of complete test forms. Concurrent calibration was used to determine item difficulty measures. These item difficulty measures were used to create the Alternate ACCESS for ELLs scale scores used for reporting results on the test.

Table 5.1.3A provides the scaling equation for each domain. This equation is used to convert an examinee's ability measure into the scale score. Since Alternate ACCESS for ELLs is vertically

equated, though each domain has its own equation, the same equation is used across all gradelevel clusters within each domain.

Table 5.1.3AScaling Equation for each Domain

Domain	Scale Score
Listening	(Ability Measure in Logits*7.913)+925.056
Reading	(Ability Measure in Logits*6.026)+925.788
Speaking	(Ability Measure in Logits*4.433)+924.531
Writing	(Ability Measure in Logits*2.4)+926.408

5.1.4 DIF Analyses

Differential item analyses (DIF) attempt to investigate whether performances on items or tasks were influenced by factors extraneous to English language proficiency (i.e., the construct being measured on the test). In other words, it attempts to find items or tasks that may be functioning differently for different groups based on criteria irrelevant to what is being tested. The performance of students on the Alternate ACCESS for ELLs tasks was compared by dividing students into two different groupings: first, males versus females; second, students of Hispanic ethnic background versus students of non-Hispanic ethnic background (For both analyses, students for whom test scores and gender or ethnicity was missing were excluded). The underlying assumption of DIF analysis is that students who performed similarly overall on the test should perform similarly on the individual tasks. To test this assumption, students are initially placed into groups based on their total raw scores by domain. Then, student performance on a task of interest within that domain, the studied item, is compared between groups.

The Mantel Chi-square statistic and the standardized P-DIF (i.e., the DIF procedure used for polytomous items) or the standardized mean difference (SMD) procedures developed by the Education Testing Service (ETS) (Zwick, Donoghue, & Grima, 1993; Allen, Carlson, & Zalanak, 1999) for polytomous items were used for identifying tasks that exhibit DIF. JMetrik (Meyer, 2014), an open source computer program for psychometric analysis, was used in conducting the analyses. The procedures first calculate the Mantel statistic and determine its probability of significance. This statistic gives an indication of the probability that observed differences are the result of chance but does not indicate how significant that difference is. To indicate how significant the difference is, the SMD between the performances of the two groups being compared is calculated. The SMD compares the means of the two groups, adjusting for differences in the distribution of the two groups being compared across the values of the total raw scores. To standardize the outcome, this difference is divided by the standard deviation (SD) of the task for the total group. The ratio of SMD over SD serves as an effect size measure for the Mantel Chi-square statistic. Since this effect size measure can be positive or negative which may present some challenges when interpreting them, it is divided by the item score range in JMetrik (Meyer, 2014) such that the range of the rescaled effect size (called standardized P-DIF* on the JMetrik DIF output) is restricted to 0 and 1. The effect size flagging criterion for polytomous items, proposed by ETS (Allen, Carlson, & Zalanak, 1999) was also rescaled to the standardized P-DIF* metric (Meyer, 2014).

Following guidance proposed by ETS for NAEP assessment (Allen, Carlson, & Zalanak, 1999), Alternate ACCESS for ELLs tasks are classified into three DIF levels as follows:

- AA (no DIF), when the Mantel Chi-square statistic is not significant or when it is significant and standardized P-DIF* is less than 0.05
- BB (weak DIF), when the Mantel Chi-square statistic is significant and standardized P-DIF* is greater than or equal to 0.05 but less than 0.10
- CC (strong DIF), when the Mantel Chi-square statistic is significant and standardized P- DIF* is greater than or equal to 0.10

5.1.5 Reliability of Composites

Four composite scores are reported for Alternate ACCESS: Oral Language Composite (oral), Literacy Composite (litr), Comprehension Composite (cphn), and Overall Composite (over). To estimate the reliability of these composite scores, a stratified Cronbach's alpha coefficient (e.g., Kamata, Turhan, & Darandari, 2003; April, Kane, & Case, 2004; Rudner, 2001) is computed, weighted by the contribution of each domain score into the composite. Specifically, the formula is

$$\alpha_{\epsilon} = 1 - \frac{\sum_{j=1}^{k} w_j^2 \sigma_j^2 (1-\rho_j)}{\sigma_{\epsilon}^2}$$

where

k = number of components j

 w_j = domain weight of component j

 σ_j^2 = variance of component j

 σ_c^2 = variance of composite

 ρ_j = reliability coefficient of component j.

The data to compute the stratified Cronbach's alpha is provided in the appropriate tables in Chapter 6.

5.1.6 Accuracy and Consistency of Classification

For each domain across grade-level clusters, as well as for the four composite scores, tables were produced that indicate estimates of the accuracy and consistency of classification of examinees into the Alternate ACCESS for ELLs language proficiency levels based on their performances on the test. It is important to know the reliability of any student's test score and the degree of precision with which it has been measured (i.e., the estimate of the invariant standard error of measure [SEM] of classical test theory and the estimate of the variable conditional standard error of the Rasch measurement model). However, because decisions about students are ultimately made on the basis of their classification into language proficiency levels on the basis of their performance on Alternate ACCESS for ELLs[®], it is important to know how well these classifications are made. The analyses that we employed make use of the methods outlined and

implemented in Livingston and Lewis (1995) and Young and Young (1998) as implemented in the software program BB-CLASS (Brennan, 2004) (cf. also Lee, Hanson, & Brennan, 2002).

In the approach of Livingston and Lewis (1995), the accuracy of a decision is the extent to which decisions made on the basis of the administered test (i.e., the observed scores) would agree with the decisions that would be made if each student could somehow be tested with all possible parallel forms of the assessments; that is, decisions based on the examinees' "true score." On the other hand, the consistency of a decision is the extent to which decisions made on the basis of the administered test would agree with the decisions that would be made if the students had taken a different but parallel form of the test. Thus, in every analysis of classification, two parallel analyses are made: accuracy (that is, vis-à-vis "true scores") and consistency (that is, vis-à-vis a second form).

In terms of classifications around a single cut point, students can be misclassified in one of two ways. Students who were below the proficiency cut score (based on their "true score"), but were classified on the basis of the assessment as being above the cut score, are considered to be false positives. Students who were above the proficiency cut score (based on their "true score"), but were classified as being below a cut score, are considered to be false negatives. All other students are considered to be accurately placed either above or below the cut score.

Since a 'true score' is a theoretical construct, it is unknown for any given student. The approach taken by Livingston and Lewis (1995) and implemented here *to model true scores* uses information about the reliability of the test, the cut scores, and the observed distribution of scores. Then, using a four-parameter beta distribution, we modeled the distribution of the true scores and of scores on a parallel form. Overall accuracy and consistency indices are produced by comparing the percentage of students classified across all categories the same way by both the observed distribution and modeled distribution. These indices indicate the percent of all students who would be classified into the same language proficiency level by both the administered test and either the true score distribution (accuracy) or a parallel test (consistency). Our tables also provide an estimate of Cohen's kappa statistic, which is a very conservative estimate of the overall classification since it corrects for chance.

We also look at accuracy and consistency conditional on the language proficiency level. These indices examine the percent of students classified by both tests into a level divided by all students classified into that level according either to the true score distribution (accuracy) or based on a parallel test (consistency).

Finally, we look at what may be the most important set of indices, which are the indices at the cut points. That is, at every cut point, using the true score distribution (e.g., accuracy), we provide the percent of students who are consistently placed above and below the cut score, as well as those who are false positives and false negatives. For consistency, only the percent of students classified consistently above and below the cut score is calculated. Thus, for example, to evaluate the degree of confidence that one can have in a decision made based on the Overall Composite score as to whether students are being accurately classified into Alternate WIDA language proficiency level P2 ("Beginning") or not, one can look at the accuracy index provided in the table for the cut score P1/P2.

5.2 Descriptions

The following paragraphs describe the tables and figures that appear in Chapter 6. Each description applies to each test form in each domain. Information on raw and scale score descriptive statistics, proficiency level distribution, and the equating summary, are displayed in tables/figures A-D. Reliability, item analysis summary, complete item analysis, raw score to scale score conversion, and raw score to proficiency level conversion tables are provided in tables E-I. These tables are organized by: grade, grade-level cluster, domain, domain and composite scores.

Note that because the composite scores do not have raw scores associated with them, any table or figure that draws on raw scores is not included for the composite scores. This includes Table A, Table D, Table F, Table G, Table H and Table I, and Figure A, Figure D and Figure E.

5.2.1 Raw Score Information (Figure A and Table A)

Figure A and Table A relate to the raw scores on each test form (the raw score to proficiency level conversion table for each test form is displayed in Table I in each section). All domains were scored polytomously. The highest possible score for Listening and Reading is 36 (4 points per item for 9 items). The highest possible score for Speaking is 16 (2 points per item for 8 items). The highest possible score for Writing is 24 (Writing parts A & B: 2 points per item for 8 items; Writing part C: 4 points per item for 2 items). For each test form, Figure A shows the distribution of the raw scores. The horizontal axis shows the raw scores. The vertical axis shows the number of students (count). Each bar shows how many students were awarded each raw score.

Table A shows the following information, by each grade in the cluster and by total for the cluster:

- The number of students in the analyses (the number of students who were not absent, invalid, refused, exempt, or in the wrong cluster)
- The minimum observed raw score
- The maximum observed raw score
- The mean (average) raw score
- The standard deviation (std. dev.) of the raw scores

5.2.2 Scale Score Information (Figure B and Table B)

Figure B and Table B relate to the *scale scores* on each test form. For each test form, raw scores were converted to vertically-equated scale scores. The raw score to scale score conversion table for each test form is displayed in Table H in each section. Thus, for each test form, Figure B shows the distribution of the scale scores. The horizontal axis shows the scale scores based on performances on the test form. The vertical axis shows the number of students (count). Each bar shows how many students were awarded each scale score.

Table B shows the following information, by each grade in the cluster and by total for the cluster:

- Number of students in the analyses
- The minimum observed scale score
- The maximum observed scale score
- The mean (average) scale score
- The standard deviation (std. dev.) of the scale scores

5.2.3 Proficiency Level Information (Figure C and Table C)

Figure C and Table C provide information on the proficiency level distribution of the students who took the test form based on their performance. Thus, for each test form, Figure C shows the information graphically for the cluster as a whole. The horizontal axis shows five out of six Alternate WIDA proficiency levels.⁴⁴ The vertical axis shows the percent of students. Each bar shows the percent of students who were placed into each proficiency level in the domain being tested on this test form.

Table C shows the following information, by each grade in the cluster and by total for the cluster:

- The Alternate WIDA proficiency level designation (A1-A3; P1-P2)
- The number of students (count) whose performance on the test form placed them into that proficiency level in the domain being tested
- The percent of students, out of the total number of students taking the form (by grade or by total for the cluster), who were placed into that proficiency level in the domain being tested

5.2.4 Equating Summary Table (Table D)

No equating summary is presented because the Alternate ACCESS Series 101 was not equated. There is no change from the Series 100 field test. Thus, the results from the original field test of Alternate ACCESS were used to determine raw-to-scale score conversions. Technical details of the analysis of this process can be found in the *Alternate ACCESS for ELLs* TM Series 100 Development and Operational Field Test: Technical Report (2013).

5.2.5 Reliability (Table E)

Table E presents reliability information based on Classical Test Theory and shows the following information:

- The number of students
- The number of items
- Cronbach's coefficient alpha (as a measure of internal consistency)
- The classical standard error of measurement (SEM) in terms of *raw scores*

Cronbach's coefficient alpha is widely used as an estimate of reliability, particularly of the

⁴ In Series 101, only the Alternate WIDA proficiency levels A1, A2, A3, P1 and P2 were reported. In Series 102, the proficiency level P3 will be reported as well.

internal consistency of test items. It expresses how well the items on a test appear to measure the same construct. Conceptually, it may be thought of as the correlation obtained between performances on two halves of the test, if every possibility of dividing the test items in two were attempted. Thus, Cronbach's alpha may be low if some items are measuring something other than what the majority of the items are measuring. As with any reliability index, it is affected by the number of test items (or test score points that may be awarded). That is, all things being equal, the greater the number of items, the higher the reliability.

Cronbach's alpha is also affected by the distribution of ability within the group of students tested. All things being equal, the greater the heterogeneity of abilities within the group of students tested (i.e., the more widely the scores are distributed), the higher the reliability. In this sense, Cronbach's alpha is sample dependent. It is widely recognized that reliability can be as much a function of the test as of the sample of students tested. That is, the exact same test can produce widely disparate reliability indices based on ability distribution of the group of students tested.

The formula for Cronbach's alpha is

$$\alpha = \frac{n}{n-1} \left[1 - \frac{\sum_{i=1}^{n} \sigma_i^2}{\sigma_t^2} \right]$$

where

n = number of items i

 σ_i^2 = variance of score on item *i*

 σ_t^2 = variance of total score

Table E also presents the *standard error of measurement* (SEM) based on classical test theory. Unlike IRT, in this approach, SEM is seen as a constant across the spread of test scores (ability continuum). Thus, it is *not* conditional on ability being measured. It is, however, a function of two statistics: the reliability of the test and the (observed) standard deviation of the test scores. It is calculated as

SEM =
$$SD\sqrt{1-reliability}$$

Traditionally, SEM has been used to create a band around an examinee's observed score. The assertion in the view of classical test theory is that the examinee's true score (i.e., what the examinee's score would be if it could be measured without error) would lie with a certain degree of probability within this band. Therefore, the statistical expectation is that an examinee's true score has a 68% probability of lying within the band, extending from the observed score minus 1 SEM to the observed score plus 1 SEM.

5.2.6 Test Characteristic Curve (Figure D)

For each test form, Figure D graphically shows the relationship between the ability measure (in logits) on the horizontal axis and the expected raw score on the vertical axis. Four vertical lines

indicate the four cut scores, dividing the figure into five sections for each of the WIDA proficiency levels (A1-A3; P1-P2) for the domain being tested. As would be expected, higher raw scores are required to be placed into higher language proficiency levels. The relative width of each section between the cut score lines, however, gives an indication of how many points must be earned to be placed into a WIDA language proficiency level.

5.2.7 Test Information Function (Figure E)

With the Rasch measurement model, as with any measurement model following Item Response Theory (IRT), the relationship between the ability measure (in logits) and the accuracy of test scores can be modeled. It is recognized that tests measure most accurately when the abilities of the examinees and the difficulty of the items are most appropriate for each other. If a test is too difficult for an examinee (i.e., the examinee scores close to zero), or if the test is too easy for an examinee (i.e., the examinee "tops out"), accurate measurement of the examinee's ability cannot be made. The test information function shows graphically how well the test is measuring across the ability measure spectrum. High values indicate more accuracy in measurement. Thus, for each test form, Figure E shows the relationship between the ability measure (in logits) on the horizontal axis and measurement accuracy, represented as the Fisher information value (which is the inverse squared of the standard error), on the vertical axis. The test information function, then, reflects the conditional standard error of measurement.

Again, as in Figure D, four vertical lines in Figure E indicate the four cut scores, dividing the figure into five sections for each of the WIDA language proficiency levels (A1-A3:P1-P2) for the domain being tested. It is important that each test form measure most accurately in the areas for which it is primarily used to make classification decisions. In other words, optimally the test information function should be high for the cuts between A1/A2, A2/A3, A3/P1, and P1/P2.

5.2.8 Item Analysis Summary (Table F)

Table F provides a summary of the analyses of the items. This table is divided into two parts: one, the item summary; two, the DIF summary. The upper half of the table displays the item summary. The first column in this part states the type of item (MOSR for multiple opportunities for selected response or CR for constructed response). The next columns show the number of items on the test form and average item or task difficulty value in logits, respectively. The following column displays the average percentage of maximum possible score points across items. The last two columns give information on the Rasch model fit statistics (see 5.1.1). The first is the average infit mean square statistic; the second is the average outfit mean square statistic. Optimally, these values should be close to 1.00.

The lower half of Table F provides a summary of the findings of the DIF analyses (see 5.1.4). The first column gives the DIF level: AA, BB, or CC. The next major columns show the contrasting groups in the DIF analyses: either male versus female (M/F) or Hispanic versus other ethnicities (H/O). Even though DIF may be negligible (category AA), this table shows the number of items that were favoring one group or the other at all levels of DIF. Optimally, even when items are all in category AA, there should be roughly an even number of items favoring each of the two groups to ensure that there is no systematic biasing test effect across items.

5.2.9 Complete Item Analysis Table (Table G)

Table G presents results of the analyses of all of the items or tasks on the test form. The first column provides a descriptive name of the item. The item names vary slightly across domains, consisting of characters that represent the domain (e.g., "R" for Reading), the language proficiency level targeted (e.g., "P2"), and the test series (e.g., 101).

The second column in Table G presents the item difficulty in logits, while the third column indicates whether that item served as a common item, anchoring the measurement scale to the results of the field test. The next column shows the percent of maximum possible score points (PMPS). This is obtained by dividing the average score by the maximum possible score point for that task, then multiplying by 100. It is basically a rescaling of the average score. The percentage of maximum possible score points is a common measure used to indicate the task difficulty for a polytomously scored task, with a higher value indicating an easier task. The next two columns show the Rasch fit statistics (see 5.1.1) for the item. The next column provides the point biserial correlation, a measure of the degree to which performance on an item corresponds with performance on the entire test form. In other words, it is a measure of how useful the item is at distinguishing between high-scoring and low-scoring test-takers. The following columns show the results of the two DIF analyses (see 5.2.8) for that item. These last columns are interpreted just as in Table F.

5.2.10 Complete Raw Score to Scale Score Conversion Chart (Table H)

Table H presents the raw score to scale score conversion for the test form. The first column shows all possible raw scores. The next column shows the corresponding scale score for the grade-level cluster.

The next column shows the *conditional* standard error (i.e., from the Rasch analysis) in the metric of the scale score. The last two columns show a lower bound (i.e., the scale score minus one standard error) and an upper bound (i.e., the scale score plus one standard error) around the scale score. In some cases the resulting lower bound or upper bound is below 910, which has been set as the lowest score on the scale.

All domains were adjusted for an end-of-scale effect by allowing the top scale scores to increase only at the same rate as the preceding scale scores. If they were not adjusted, their effect in the composite scores might be excessive.

Thus, if the scale scores towards the high end of the raw score scale were increasing with each raw score by 9 scale points before the group of adjusted scores, then each of the adjusted scores would increase by only 9 scale points each. Because the lower and upper bounds were calculated based on the original logit scores, these adjusted scores do not fall in the middle of the range; they fall toward the lower end of the range, but they always fall *within* the range. In other words, the adjusted scale score is a very possible observed score for that number of raw score points obtained.

In addition, at the lower end of the raw score scale, scale scores are truncated when necessary so that the lowest scale score given is the scale score corresponding to a proficiency level score of A1.

5.2.11 Raw Score to Proficiency Level Score Conversion Table (Table I)

Table I shows the interpretive proficiency level score associated with each raw score. The first

column in Table I shows the raw score. The remaining columns show the proficiency level score associated with each raw score/scale score for each grade in the cluster, the percentage of students in that grade who scored at that raw score/scale score/proficiency level score, and the cumulative percentage of students in that grade who scored up to that raw score/scale score/proficiency level score.

There are two things to note about this table. First, unlike scale scores, which are determined psychometrically and have a one-to-one correspondence to raw scores regardless of the grade level of the student, proficiency level scores are interpretations of the scale score. Second, for Alternate ACCESS, cut scores between proficiency levels were determined by domain and do not change by grade level.

In students with severe cognitive disabilities, the cognitive abilities that support language proficiency development are not expected to increase dramatically from one grade level to the next. At this point in the understanding of the development of ELP in such students, it appears appropriate to use the same cut scores for all grade clusters (from grades 1 to 12) by domain. In this way, it becomes easier to detect growth in ELP from year to year for this population of English learners.

5.2.12 Accuracy and Consistency of Classification Table (Table J)

Table J presents three rows of information related to the accuracy and consistency of placement into proficiency categories based on Alternate ACCESS (see above). The first row provides overall indices related to the accuracy and consistency of classification, as well as Cohen's kappa. The second row of information shows accuracy and consistency information conditional on level. The third provides indices of classification accuracy and consistency at the cut points. These indices are perhaps the most important of all when using any of these as an absolute cutpoint for placement decisions. Note that the consistency is generally higher at the cut points than over the levels. For practical purposes, the primary score used for such decisions are the Overall Composite scores. In general, the reliability and the accuracy and consistency of classification of the Overall Composite are very high for Alternate ACCESS for ELLs.

Table 6.2.1D

Equating Summary: List 3-5 S103

No equating summary is presented because the Alternate ACCESS Series 101 was not equated. There is no change from the field test Series 100. Thus, the results from the original field test of the Alternate ACCESS were used to determine raw-to-scale score conversions. Technical details of the analysis of this process can be found in the Alternate ACCESS for ELLsTM Series 100 Development and Operational Field Test: Technical Report (2013).

Equating Summary: Read 3-5 S103

No equating summary is presented because the Alternate ACCESS Series 101 was not equated. There is no change from the field test Series 100. Thus, the results from the original field test of the Alternate ACCESS were used to determine raw-to-scale score conversions. Technical details of the analysis of this process can be found in the Alternate ACCESS for ELLsTM Series 100 Development and Operational Field Test: Technical Report (2013).

Table 6.2.4D

Equating Summary: Writ 3-5 S103

No equating summary is presented because the Alternate ACCESS Series 101 was not equated. There is no change from the field test Series 100. Thus, the results from the original field test of the Alternate ACCESS were used to determine raw-to-scale score conversions. Technical details of the analysis of this process can be found in the Alternate ACCESS for ELLsTM Series 100 Development and Operational Field Test: Technical Report (2013).

Table 6.3.1D

Equating Summary: List 6-8 S103

No equating summary is presented because the Alternate ACCESS Series 101 was not equated. There is no change from the field test Series 100. Thus, the results from the original field test of the Alternate ACCESS were used to determine raw-to-scale score conversions. Technical details of the analysis of this process can be found in the Alternate ACCESS for ELLsTM Series 100 Development and Operational Field Test: Technical Report (2013).

Equating Summary: Spek 9-12 S103

No equating summary is presented because the Alternate ACCESS Series 101 was not equated. There is no change from the field test Series 100. Thus, the results from the original field test of the Alternate ACCESS were used to determine raw-to-scale score conversions. Technical details of the analysis of this process can be found in the Alternate ACCESS for ELLsTM Series 100 Development and Operational Field Test: Technical Report (2013).
