## Introduction

This report summarizes the research data analyses conducted on the Oklahoma Core Curriculum Tests End-of-Instruction (OCCT EOI) 2013 test administrations and provides data evidences in supporting the test validity and reliability of the tests.

The Oklahoma School Testing Program (OSTP) was established to improve academic achievement for all Oklahoma students, and it also meets the requirements of the No Child Left Behind (NCLB) Act (US DOE, 2002), which was introduced by the Federal Government in 2001. The OSTP is a statewide assessment program that, in an attempt to meet the needs of the students of the state of Oklahoma, encompasses three different assessment types-The Oklahoma Core Curriculum Test (OCCT), intended for regular education students; the Oklahoma Modified Alternate Assessment Program (OMAAP), referred to as the modified test and intended for most students enrolled in an Individualized Education Program (IEP) or a 504 Plan, and English Language Learners (ELL); and the Oklahoma Alternate Assessment Program (OAAP), the portfolio assessment for students with the most severe cognitive disabilities in the IEP programs.

The Oklahoma state tests are used to assess student achievement; target student, classroom, and program improvement; and inform parents of student progress. The administration of the OCCT, OMAAP, and OAAP tests fulfills the NCLB Act and state mandates for testing, mathematics and reading, and the test results are used for federal accountability. The scope and general administration of the OSTP is outlined in state law, 70 O.S. § 1210.505. Rules that govern the specifics of test administration and other details are available under Oklahoma Administrative Code (OAC) 210:10-13.

For the OCCT, Reading and Mathematics tests are administered in Grades 3-8; Science, Social Studies, and Writing tests are given in Grade 5; Geography is given in Grade 7; and Science, U.S. History, and Writing are given in Grade 8. English II, English III, Algebra I, Algebra II, Geometry, Biology I, and U.S. History are given as End-of-Instruction (EOI) tests in high school. For the OMAAP, Reading and Math tests are available in Grades 3-8 and Science is available in Grades 5 and 8 . English II, Algebra I, Biology I, and U.S. History are available as EOI tests in high school. All students must take the OCCT for content areas in which a modified assessment is not available. The Department of Special Education oversees the implementation of the OAAP, or Portfolio assessment, which includes all of the Grades 3-8 content areas and EOI for Algebra I, Algebra II, Biology I, Geometry, U.S. History, English II, and English III based on the grade level of the student in question.

This document serves to provide detailed descriptions and evidence of reliability and validity of the OCCT EOI, a component of the Oklahoma assessment system. The validity evidence is reflected in the work done by the Oklahoma State Department of Education (SDE) and CTB/McGraw-Hill in the process of the OCCT development. The validity evidence of OCCT can be found in the development of the Priority Academic Student Skills (PASS), most recently Oklahoma's Core curriculum, the College, Career and Citizen Ready ( $C^{3}$ ) content standards, the development of the Oklahoma School Testing Program (OSTP) items and operational test forms, the review of the alignment of the content to the test, the administrations of the test, the machine
scoring and handscoring of student responses, the setting of cut scores, and the psychometric analyses (Barton, 2007).

Because the OCCT results are used as part of the state and federal accountability system, CTB/McGraw-Hill follows the Standards for Educational and Psychological Testing (1999) by the American Educational Research Association (AERA), the American Psychological Association (APA), and the National Council on Measurement in Education (NCME). This technical report presents validity and reliability evidence according to the Standards. Attention is also given to requirements from the Standards and Assessments Peer Review Guidance (US DOE, 2004) and the Critical Elements (CE) for Peer Review of State summative tests. The detailed documentation is provided in the following sections of this report.

## Section 1 - Overview

The Oklahoma End-of-Instruction (EOI) assessments require that students who complete an area of instruction must also take the corresponding standardized test. Each test has the purpose of measuring each student's knowledge relative to the Oklahoma Core curriculum, the College, Career and Citizen Ready ( $C^{3}$ ) Oklahoma's content standards. These tests are part of the Achieving Classroom Excellence (ACE) legislation passed in 2005 and amended in 2006, which outlines the curriculum, the competencies, and the testing requirements for students to receive a high school diploma from the state of Oklahoma. Algebra I, English II, Biology I, and U.S. History were existing tests in the program with Algebra II, Geometry, and English III added as operational tests for the 2007-2008 testing cycle. The Spring 2009 administration was the first administration with graduation requirements attached to them for the incoming freshmen students. In order to graduate with a high school diploma from the State of Oklahoma, these students, as well as future incoming freshmen students, are required to score proficient or above on the standardized test assessments for Algebra I and English II, as well as score proficient or above in two of the following five standardized test assessments: Algebra II, Biology I, English III, Geometry, and U.S. History. Students who fail to earn a proficient score are permitted to retake these tests.

All Oklahoma secondary-level students, enrolled in a regular educational program and completing instruction in Algebra I, Algebra II, Biology I, Geometry, English II, English III, and U.S. History, must take the corresponding OCCT EOI tests. The OCCT EOI tests are administered mainly online, with the exception of the Writing Prompt (WP) in English II and English III, which are administered only in a paper/pencil format. All EOI testing administrations have one Writing Prompt (WP) for English II and English III for 2012-2013. These End-of-Instruction standardized assessment tests are administered in Winter/Trimester, Spring, and Summer including other form variations other than Operational (OP), as Braille (BR), Retest (RT), and Equivalent (EQ) forms.

In the Fall of 2012, CTB/McGraw-Hill was contracted by the Oklahoma SDE to develop, administer, and maintain the OSTP OCCT and OMAAP for ACE EOI and Grades 3-8. This technical report provides objective information regarding technical aspects of the Oklahoma OCCT EOI assessments by specifying the technical details of the work accomplished from Summer 2012 (developed, administered, and processed by Pearson) through the end of Spring 2013 on these tests. This volume is intended to be one source of information for Oklahoma K-12 educational stakeholders (including testing coordinators, educators, parents, and other interested citizens) about the development, implementation, scoring, and technical attributes of the Oklahoma OCCT EOI assessments.

Other sources of information regarding the OSTP-ACE EOI tests include the administration manual OSTP 2012-2013 Test Preparation Manual found at http://ok.gov/sde/sites/ok.gov.sde/files/TPM_EOI_w12OK Final.pdf; interpretation manuals, implementation materials, and training materials for administrators, schools, and teachers found at http://www.ok.gov/sde/test-support-teachers-and-administrators; and guides for teachers, students, and parents found at http://ok.gov/sde/assessment-administrator-resourcesadministrators.

The Summer 2012 OCCT EOI assessments for Algebra I, Algebra II, Biology I, Geometry, English II, English III, and U.S. History were developed by Pearson in collaboration with the Oklahoma SDE and were administered by the SDE. The Winter/Trimester 2012-13 and the Spring 2013 OCCT EOI for Algebra I, Algebra II, Biology I, Geometry, English II, English III, and U.S. History assessments were developed by CTB/McGraw-Hill in collaboration with the SDE and were administered by the SDE.

## Section 1.1 - Purpose

This report includes data and analysis results on the operational forms in the Summer 2012, Winter/Trimester 2012-13, and Spring 2013 administrations. A description of the Oklahoma content standards is provided in Section 1.2. - Oklahoma C ${ }^{3}$ Content Standards. All operational and field test items for the OCCT EOI Winter/Trimester 2012-13 and Spring 2013 were subjected to cycles of reviews by the SDE and CTB/McGraw-Hill (Summer 2012 by Pearson and the SDE). The item development and alignment process and test development, is detailed in Section 2 - Item and Test Development. The test administrations processes can be found in Section 3 - Administration. Discussion of the operational population and the research samples utilized in the analysis is found in Section 5 - Sampling Plan and Field Test Design. Note that relevant information from the Summer 2012 administration is occasionally shown in these sections but is not the subject of CTB/McGraw-Hill's analysis in this report.

The Summer 2012 OCCT EOI scores were based on a pre-equating design for all content areas. The Winter/Trimester 2012-13 OCCT EOI scores were mostly based on a pre-equating design, where full post-equating analyses were only conducted for English II and English III to assure comparability and stability of the pre- and post-equating results. The Spring 2013 OCCT EOI scores were based on a pre-equating design for Algebra I, Algebra II, and Geometry, where full post-equating analyses were conducted for Biology I, English II, English III, and U.S. History. The Winter/Trimester 2012-13 and Spring OCCT EOI operational and field test items were analyzed and processed separately. A complete description of the operational and field test item analyses and the calibration/scaling and equating analyses is found in Section 6 - Methods and Section 7 - Results. A summary of reliability and validity for different levels of analyses is found in Section 8 - Summary of Reliability and Validity.

## Section 1.2 - Oklahoma $C^{3}$ Content Standards

CTB/McGraw-Hill developed the Winter/Trimester 2012-13 and the Spring 2013 Oklahoma OCCT EOI assessments to measure the Oklahoma $C^{3}$ content standards, which are shown in Table 1.1. The objectives associated with the content and/or process standards tested are provided in Appendix A.

## Section 2 - Item and Test Development

In the Summer 2012 and Winter/Trimester 2012-2013 administrations, there was one operational form with embedded sets of field test items for the tests administered for Algebra I, Algebra II, Geometry, English II, English III, Biology I, and U.S. History. In the Spring 2013
administration, there were two Core Operational forms (A, B) and each form was embedded with sets of field test items to add to the item pool. This resulted in 8 field test forms for Algebra I, Algebra II, English II, English III, and Geometry; 7 field test forms for Biology I; and 10 field test forms for U.S. History. For each administration, a Braille form, an Equivalent form, and a Retest form are produced.

The Braille form is usually a mirror of the operational form. The Equivalent, designated as a breach form, and the Retest forms usually are a reproduction of past administration forms, except for the open-ended items or Writing Prompts. A student could receive an Equivalent form for various reasons, such as becoming ill during test administration or experiencing any kind of security breach. The Oklahoma State Department of Education Office of Accountability and Assessments determines eligibility for an Equivalent form on a case-by-case basis.

## Test Design

For Summer 2012 and Winter/Trimester 2012-13, CTB/McGraw-Hill Content Development selected repurposed forms approved by the SDE for operational use. CTB Research analyzed the selected forms and provided feedback to CTB Content Development regarding item position. Adjustments were made by Content Development based on Research feedback. For Spring 2013, Content Development selected items from the available item pools that had been field tested previously and approved by the SDE staff for usage on operational assessments. Field test items were selected from items approved by the SDE and Oklahoma teachers. CTB Research analyzed the selected items and provided feedback to Content Development regarding the best set of items for the Spring 2013 operational form.

Specifically, Research reviewed the forms for comparability of blueprints; total test information; cut score test information; standard errors of measurement; raw score to scale score stability (particularly at the cut scores); item locations (difficulty parameters) for all items within a form and item information levels; test characteristic curves (TCCs) for each form selected compared to a reference form, the Spring 2012 operational form.

Table 2.1 to Table 2.3 provide overviews of the number of operational and field test items that composed the Summer 2012, Winter/Trimester 2012-13, and Spring 2013 OCCT EOI assessments. The Summer 2012 and Winter/Trimester 2012-13 tests were comprised of one core operationally-scored form for each subject. Field test items were embedded in the operational test for all content areas. The Spring 2013 test was comprised of two Core Operational forms (A, B), for each subject. Field test items were embedded in the operational test forms for all content areas to build the item bank for future use. The forms in the Spring 2013 assessments were randomly assigned within classrooms to obtain randomly-equivalent samples of examinees for the field test items. Although most items were unique to each form, approximately 17 items were
common across the core forms. The number of common linking items per subject is presented in Table 2.4.

Table 2.1. Configuration of the OCCT EOI Tests for Summer 2012

| Subject | Forms | Item Counts (Per Form) |  |  | Maximum Possible Points on Test Items (Per Form) |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| U.S. History | 1 | 60 | 10 | 70 | 60 |  | 10 |  |

Note: OP = Operational; FT = Field Test; MC = Multiple-Choice; OE = Open-Ended

Table 2.3. Configuration of the OCCT EOI Tests for Spring 2013

| Subject | Forms | Item Counts (Per Form) |  |  | Maximum Possible Points on Test Items (Per Form) |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | OP |  | FT |  |
|  |  | OP | FT | Test | MC | OE | MC | OE |
| Algebra I | 8 | 55 | 10 | 65 | 55 |  | 10 |  |
| Algebra II | 8 | 55 | 10 | 65 | 55 |  | 10 |  |
| Biology I | 7 | 60 | 15 | 75 | 60 |  | 15 |  |
| English II | 8 | 61 | 15 | 76 | 60 | 6 | 15 |  |
| English III | 8 | 62** | 15 | 78 | 61 | 10 | 15 |  |
| Geometry | 8 | 55 | 10 | 65 | 55 |  | 10 |  |
| U.S. History | 10 | 60 | 15 | 75 | 60 |  | 15 |  |

Note: OP = Operational; FT = Field Test; MC = Multiple-Choice; OE = Open-Ended;
** = English III has one suppressed item, reducing the total possible points to 71.
Table 2.4. Number of Common Linking Items per Subject for Spring 2013

| Subject | No. of CL <br> Items | Total No. of <br> Items* |
| :--- | :---: | :---: |
| Algebra I | 17 | 38 |
| Algebra II | 17 | 38 |
| Biology I | 16 | 44 |
| English II | 19 | $41^{* * * *}$ |
| English III | $18^{* *}$ | 43 |
| Geometry | 17 | 38 |
| U.S. History | 17 | $43^{* * *}$ |

Note: No. = Number; CL = common linking;

* $=$ Number of unique operational items per form.
** = English III has one suppressed common item.
*** $=$ U.S. History Form B has one suppressed unique item.
**** $=$ English II has one suppressed unique item.

## Section 2.1 - Aligning Test to Oklahoma $C^{3}$ Content Standards

In general, alignment is a process that provides experts the opportunity to make item-level judgments about the grade level, standards, and indicators to which items should be aligned. There are multiple points in the alignment process at which assessment items are either created or evaluated for alignment to content. Most tests, particularly high-stakes, large-scale assessments, are built via rigorous and well-researched methodologies. They are guided by welldefined content and by the boundaries within the content that can be reasonably assessed in a testing environment. Such guidance is typically in the form of item specifications and test blueprints. The item specifications help define which content standards can be assessed by a test (and which content standards are better assessed in the classroom), the breadth and depth of the content that may be limited for the test, and the format and types of items appropriate for the content being assessed (e.g., multiple-choice or open-ended item). The test blueprint defines the proportion of the content to be covered on the test that best reflects the proportional importance and coverage of the standards in the classroom.

A list of the assessable standards for each subject is provided in Table 2.5 for Algebra I, Algebra II, Geometry, English II, English III, Biology I, and U.S. History. In addition to the test blueprints provided by the SDE, Table 2.6 describes four criteria for test alignment with the Oklahoma $C^{3}$ Content Standards and objectives.

Table 2.5. Testable Standards for OCCT EOI

|  | Algebra I |
| :--- | :---: |

| Era, 1878-1900 |  |

Table 2.6. Criteria for Aligning the Test with Oklahoma $C^{3}$ Standards and Objectives

|  | The test is constructed so that there are at least six items <br> measuring each Oklahoma $C^{3}$ standard with the content <br> category consistent with the related standard. The number <br> of items, six, is based on estimating the number of items <br> that could produce a reasonably reliable estimate of a <br> student's mastery of the content measured. |
| :--- | :--- |
| 2. Categorical Concurrence |  |

Data review represents a critical step in the test development cycle. At the data review meeting, the SDE and CTB/McGraw-Hill staff had the opportunity to review actual student performance on the newly-developed and field tested Multiple-Choice items across the seven subjects based on the Winter/Trimester 2012-13 and Spring 2013 field test administrations. The data review focused on the content validity, curricular alignment, and statistical functioning of field tested items prior to selection for operational test forms. The field test results used in the data review provided evidence that the items were designed to yield valid results and were accessible for use by the widest possible range of students. The review of student performance should provide evidence regarding the fulfillment of requirement 200.2(b)(2)of NCLB. The purpose of the review meeting was to ensure that psychometrically-sound, fair, and aligned items are used in the construction of the ACE EOI assessments and entered into the respective item banks.
CTB/McGraw-Hill provided technical and psychometric expertise and a clear explanation about the items' content, the field test process, the scoring process, and the resulting field test data to ensure the success of these meetings and the defensibility of the program.

Data review meetings were a collaborative effort between the SDE and CTB/McGraw-Hill. The SDE administrators and content specialists attended the training facilitated by CTB/McGraw-Hill content specialists and research scientists on best practices involved in interpreting and reviewing the field test data. Meeting materials included a document explaining the flagging criteria, a document containing flagged items, and the item images. CTB/McGraw-Hill discussed with the SDE the analyses performed and the criteria for flagging the items. Each of the flagged items was then reviewed, and the decision was made to accept the item, accept the item for future re-field testing with revisions, or reject the item. Review of the data included presentation of $p$-value, point-biserial correlation, point-biserial correlation by response option, response distributions, mean overall score by response option, and indications of item differential item functioning (DIF) and item response theory (IRT) misfit. Items failing to meet the requirements of sound technical data were carefully considered for rejection by the review panel, thereby enhancing the reliability and improving the validity of the items remaining in the bank for future use. Although the panel used the data as a tool to inform their judgments, the panel (and not the data alone) made the final determination as to the appropriateness or fairness of the assessment items. The flagging criteria for the ACE EOI assessments are as follows:

- $p$-value <. 25 or $>.90$
- point-biserial correlation <. 15
- distractor point-biserial correlation > . 05
- Differential Item Functioning (DIF): test item biases for subgroups
- IRT misfit as flagged by the $Q_{1}$ index (see Section - 6.3 Calibration \& Item Fit)

## Bias and Sensitivity

One aspect of the data review meetings was to assess potential bias based on DIF results and item content. Although bias in the items had been deflected by writer training and review processes, there is always the potential for bias to be detected through statistical analysis. This step in the development cycle is essential because the SDE and CTB/McGraw-Hill seek to avoid inclusion of items biased in any manner against a group, because these items may lead to inequitable test results. As described earlier, all field test items were analyzed statistically for DIF using the field test data. A CTB/McGraw-Hill research scientist explained the significance,
in terms of level, and the direction of the DIF flags. The data review panel reviewed the item content, the percentage of students selecting each response option, and the point-biserial correlation for each response option by gender and ethnicity for all items flagged for DIF. The data review panel was then asked if there was context (e.g., cultural barriers) or language in an item that might result in bias and provide an explanation for the existence of the statistical DIF flag.

Once items were written, they were reviewed to assure the items were appropriate for and aligned to the grade level, the Oklahoma $C^{3}$ Standard and objective, and the DOK intended. The items were also reviewed to assure they were accurate, written at an appropriate reading level for the grade, written at an appropriate level of difficulty, and did not contain sensitive or potentially biased issues.

Statistical bias analyses were performed as part of the development, review, and fairness efforts. Field test items were analyzed for statistical bias utilizing the Mantel-Haenszel method (MH; Mantel \& Haenszel, 1959; Holland \& Thayer, 1988; Michaelides, 2008). The results for Winter/Trimester 2012-13 and Spring 2013 are found in Section 7 - Results of this report.

## Section 2.2 - Item Pool Development and Selection

The source of the operational items included a pool of previously field tested or operationallyadministered items ranging from the Spring 2005 through the Spring 2012 administrations for Algebra I, Biology I, English II, and U.S. History and from the census Spring 2007 field test through the Spring 2011 embedded field test for Algebra II, Geometry, and English III. The items were calibrated live using data from the operational administrations to estimate the items' parameters.

The ACE EOI tests for the Winter/Trimester 2012-13 and Spring 2013 cycle were built by including previously field tested and operational items. Content experts targeted the percentage of items measuring various Depth of Knowledge (DOK) levels for assembling the tests. Table 2.7 provides the DOK level percentages for the Summer 2012, Winter/Trimester 2012-13 and Spring 2013 operational assessments. During test construction, every effort was made to construct test forms that met the target percentages as closely as possible.

## Blueprints

## Text and Item Development Process

To ensure content validity of the Oklahoma OCCT EOI tests, CTB/McGraw-Hill content experts carefully studied the Oklahoma $C^{3}$ Standards and/or the Priority Academic Student Skills (PASS) content standards. They worked with Oklahoma content area specialists, teachers, and assessment experts to gather a pool of existing items that measure Oklahoma's Assessment Frameworks (i.e., Oklahoma $C^{3}$ ) for each subject. Once the need for field test items was determined, based on the items' availability for future test construction, a pool of items was developed to measure Oklahoma $C^{3}$ in each subject. These items were developed under universal design guidelines set by the SDE and carefully reviewed and discussed by Content and

Bias/Sensitivity Review Committees. These committees, comprised of Oklahoma teachers and SDE staff, evaluated items' content for validity, plain language, and the quality and appropriateness. The committees' recommendations were used to select and/or revise items from the item pool used to construct the field test portions of the Winter/Trimester 2012-13 and the Spring 2013 assessments.

Item selection and form development for the Spring 2013 cycle was completed as a collaborative effort between the SDE staff and CTB/McGraw-Hill Content Development and psychometricians (Research). The primary criterion for the selection of items was to meet the content specifications represented by test blueprints and statistical guidelines. Within the limits set by these requirements, such as classical and IRT statistics, described in Section 6 - Methods, editors selected items with the best content-relevant and statistical characteristics.

The OCCT EOI Operational tests for the Winter/Trimester 2012-13 and the Spring 2013 cycle were built by including previously field tested and operational items. Content experts also targeted the percentage of items measuring various DOK levels when assembling the tests.

Table 2.7 provides the DOK level percentages for the Summer 2012, Winter/Trimester 2012-13, and Spring 2013 operational assessments.

Table 2.7. Percentage of Items by Depth of Knowledge Levels

| Test Session | DOK | Target | Actual \% |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Level | DOK \% | Algebra I | Algebra II | Biology I $^{1}$ | English II |
| Summer | 1 | $10-15$ | 15 | 13 | 17 | 15 |
| 2012 | 2 | $60-70$ | 65 | 65 | 63 | 60 |
|  | $3 / 4$ | $15-25$ | 20 | 22 | 20 | 25 |
| Winter/ | 1 | $10-15$ | 13 | 15 | 12 | 7 |
| Trimester | 2 | $60-70$ | 67 | 69 | 45 | 70 |
| $2012-13$ | $3 / 4$ | $15-25$ | 20 | 16 | 43 | 23 |
| Spring 2013 | 1 | $10-15$ | 16 | 16 | 13 | 10 |
| Core A | 2 | $60-70$ | 69 | 62 | 50 | 74 |
|  | $3 / 4$ | $15-25$ | 15 | 24 | 37 | 16 |
| Spring 2013 | 1 | $10-15$ | 15 | 16 | 13 | 16 |
| Core B | 2 | $60-70$ | 71 | 60 | 53 | $64^{*}$ |
|  | $3 / 4$ | $15-25$ | 16 | 24 | 33 | 18 |

Note: For Biology I, the target DOK percentages are 10-15 for DOK level 1, 55-65 for DOK level 2, and 25-35 for DOK level 3 for the school year of 2012-13.

* = English II one DOK level 2 item was suppressed in Form B.

Table 2.7. Percentage of Items by Depth of Knowledge Levels (cont.)

| Test Session | DOK <br> Level | Target DOK \% | Actual \% |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | English III | Geometry | U.S. History |
| Summer | 1 | 10-15 | 8 | 18 | 10 |
| $2012$ | 2 | 60-70 | 76 | 64 | 67 |
|  | 3/4 | 15-25 | 16 | 18 | 23 |
| Winter/ | 1 | 10-15 | 13 | 15 | 7 |
| Trimester | 2 | 60-70 | 68 | 69 | 68 |
| 2012-13 | 3/4 | 15-25 | 19 | 16 | 25 |
| Spring 2013 | 1 | 10-15 | 6 | 16 | 7 |
| Core A | 2 | 60-70 | 76* | 64 | 73 |
|  | 3/4 | 15-25 | 16 | 20 | 20 |
| Spring 2013 | 1 | 10-15 | 5 | 16 | 5 |
| Core B | 2 | 60-70 | 73* | 62 | 75** |
|  | 3/4 | 15-25 | 21 | 22 | 18 |

Note: For Biology I, the target DOK percentages are 10-15 for DOK level 1, 55-65 for DOK level 2, and 25-35 for DOK level 3 for the school year of 2012-13.
*= English III: one DOK level 2 item was suppressed in Form A and in Form B.
** $=$ U.S. History: one DOK level 2 item was suppressed in Form B.

## Section 3 - Administration

To ensure a valid and reliable assessment, the OCCT EOI tests are first constructed in alignment with the Oklahoma $C^{3}$ Standards (now called the Oklahoma Academic Standards) by the Oklahoma SDE in collaboration with CTB/McGraw-Hill. The tests are then administered and scored according to sound measurement principles for the purpose of evaluating validity. Additionally, best practices require that the test administering and scoring entities perform their tasks in a consistent manner throughout the state so that all students have a fair and equitable opportunity for a score that reflects their achievement in each subject.

Schools play a key role in administering the OCCT EOI assessments in a manner that is consistent with established procedures, monitoring the fair administration of the assessment, and working with the SDE office to address deviations from established assessment administration best practice procedures. School faculty members play a vital role in the success of OCCT EOI assessments by ensuring fairness in administration of the test.

## Section 3.1 - Packaging and Shipping

In order to provide secure and dependable services for the shipping of the OCCT EOI assessment materials, CTB/McGraw-Hill's Transportation Department maintains the quality and security of material distribution and return by hiring reputable carriers that possess the ability to trace shipments. CTB/McGraw-Hill uses all available tracking capabilities to provide status information and early opportunities for corrective action.

Materials are packaged by school and delivered to the district test coordinators. Each shipment to a district contains a shipping document set that includes a packing list for each school's materials.

Materials are packaged using information provided by the test coordinators through the CTB/McGraw-Hill Precode Utility (EOI) or the Oklahoma WAVE system (Grades 3-8). Oklahoma educators also use these systems to provide CTB/McGraw-Hill with the precode information needed to print student barcode labels, which are affixed on answer documents or consumable test books. The bar-coding of all secure materials at the time of production allows for accurate tracking of these materials through the entire packing, delivery, and return process. This allows CTB/McGraw-Hill to inventory all materials throughout the packaging and delivery process.

## Section 3.2 - Materials Return

The Test Preparation Manual and Materials Return poster provide clear instructions on how to assemble, box, label, and return testing materials after test administration. CTB/McGraw-Hill utilizes double-column boxes to distribute and collect test materials, and makes additional cartons available for order in order to meet the various return needs of the districts.

Stack cards and paper bands are provided to group and secure used student response booklets for scoring. Color-coded return labels with pre-printed return information are also provided. These
labels facilitate the sorting of each carton and its contents upon receipt at CTB/McGraw-Hill's Data Processing Facility.

## Section 3.3 - Materials Discrepancies Process

 student writing images. Test security form information is also captured electronically via a secure database. All scorable material discrepancies are captured, investigated by the CTB/McGraw-Hill Oklahoma Help Desk, reported, and the results are subsequently reported to the Oklahoma SDE.

A pre-determined date is set by the SDE and CTB/McGraw-Hill in order to account for any materials that arrive after the scheduled deadline. Late-arriving material is processed up to the agreed-upon date, at which point the Oklahoma SDE must be notified of any late-arriving documents and render a processing decision. Following an initial call campaign to all districts with outstanding secure material, the CTB/McGraw-Hill Oklahoma Program Management team notifies the SDE regarding unresolved material discrepancies presented in a preliminary file. A subsequent call or email campaign may be conducted based on the results of the initial effort. Final missing inventory reports are then provided to the SDE. CTB/McGraw-Hill takes test security seriously and makes every effort to recover missing material.

## Section 4 - Scoring

The OCCT EOI Spring 2013 test books included MC items that were machine scored and extended writing prompt items that were scored by trained human or "hand" scorers (raters). The MC items were scanned and scored as correct or incorrect according to predefined answer keys. Items that had multiple marked answers or were blank were treated as incorrect.

The Writing test is one portion of the OCCT EOI English II and English III tests. Each writing response receives two types of scores. First, a series of analytic scores focus on specific writing traits. These traits receive scores of 1 to 4 . Next, a composite score is derived by providing a differential weight or percentage to the score in each of the analytic traits and applying a formula to obtain the final Writing score, which ranges from 1 to 6 for English II and from 1 to 10 for English III. Condition codes are used if the student's writing response is unscorable. Students do not receive separate reports for English II and English III Writing; the results are reported with the MC results.

## Scoring Rubrics

Scoring rubrics were provided by the Oklahoma SDE. The rubrics focus on five specific writing skills: Ideas and Development; Organization, Unity, and Coherence; Word Choice; Sentences and Paragraphs; and Grammar, Usage, and Mechanics. Each trait is rated from 4 (the highest score) to 1 (the lowest score).

## Anchor Papers

The OCCT EOI English II and English III writing prompts underwent field testing by the previous contractor. The SDE provided CTB/McGraw-Hill with approved anchor sets for these field tested items during the contract transition period. The English II OCCT and OCCT Equivalent writing prompts were newly developed versions of the English II Form A and English II Equivalent prompts. Anchor paper candidates were selected by Handscoring staff and submitted to the SDE for review and approval, and used in rater training and scoring of the OCCT writing responses.

Anchor sets for English II and English III writing prompts were presented to raters by trait, with three examples for each of the four score points. The OCCT prompts utilize a four-point analytic rubric for each of five traits.

## Section 4.1 - Hand Scoring

Handscoring involves training and qualifying team leaders and raters, monitoring scoring accuracy and production, and ensuring the security of both the test materials and the scoring facilities. An explanation of the training and qualification procedures follows.

## Training, Qualification, and Checkset Materials

All raters were trained and qualified in specific rater item blocks (RIBs), each of which consisted of a single writing prompt. Raters and team leaders were trained using the following steps:

- Provide a general introduction to OCCT EOI
- Introduce and review the writing prompts and scoring rubrics
- Review anchor papers and training papers, and answer questions arising from established scores
- Explain scoring strategies, followed by a question-and-answer period
- Administer Qualifying Round 1
- Review Qualifying Round 1 established scores, and answer questions arising from the scores.
- Administer Qualifying Round 2 (if necessary)
- Explain condition codes and sensitive paper procedures
- Explain unscannable image procedures

All raters were trained and qualified using the same procedures and criteria used for the team leaders, who had been trained prior to the training of the raters. The qualification process was conducted through the Online Training System and proctored by Handscoring Supervisors and team leaders. The Online Training System enabled supervisors to determine whether a rater had qualified upon completion of the set. The CTB/McGraw-Hill Handscoring Supervisors proctored the training of the team leaders.

Throughout the course of handscoring, calibration sets of pre-scored papers (checksets/validity sets) were administered daily to each rater to monitor scoring accuracy and to maintain a consistent focus on the established rubrics and guidelines. Checksets were executed via imaging software that provided images in a manner so that the rater did not know when a checkset was being administered.

The CTB/McGraw-Hill Data Monitoring staff ran inter-rater reliability reports throughout live scoring to look for any raters who were struggling and in need of retraining. Retraining involved a one-on-one discussion between the team leader (or Handscoring Supervisor) and the rater, who discussed the scoring concerns as well as the scoring guides and, if necessary, training papers. If the rater's accuracy on checkset scores did not meet the quality standards after this retraining, they were dismissed from the project immediately.

In addition to the checkset process, CTB/McGraw-Hill's handscoring protocol included the use of read-behinds (spot-checks during live scoring). The read-behind was another valuable raterreliability monitoring technique that allowed a team leader to review a rater's scored documents and provide feedback and counseling as appropriate.

## Selection of Handscorers

CTB/McGraw-Hill and Kelly Services, Inc., strive to develop a highly qualified, experienced core of raters so that the integrity of all projects is appropriately maintained.

CTB/McGraw-Hill requires that all content experts, team leaders, and raters possess a bachelor's degree or higher. Kelly Services, Inc., carefully screened all new applicants and required them to produce either a transcript or a copy of the degree. Kelly Services, Inc., also required a one- to
two-hour interview/screening process. Individuals who did not present proper documentation or had less than desirable work records were eliminated during this process. Kelly Services, Inc., verified that $100 \%$ of all potential raters met the degree requirement. All experienced raters and team leaders had already successfully completed the screening process.

All potential raters completed a pre-interview activity. For some parts of the pre-interview activity, applicants were shown examples of test responses and were supplied with a scoring guide. In a brief introduction, they became acquainted with the application of a rubric. After the introduction, applicants applied the scoring guide to score the sample responses. Each applicant's scores were used for discussion during the interview process to determine the applicant's trainability as well as an ability to understand and implement the standards set forth in the sample scoring guide.

Kelly Services, Inc., interviewed each applicant and determined the applicant's suitability for a specific content area and grade level. Applicants with strong leadership skills were interviewed further to determine whether they were qualified to be team leaders.

When Kelly Services, Inc., determined that applicants were qualified, they were recommended for employment. All assignments were made according to availability and suitability. Before being hired, all employees were required to read, agree to, and sign a nondisclosure agreement outlining CTB/McGraw-Hill business ethics and security procedures.

Security guards were on-site whenever employees were present in the building. All employees were issued identification badges and required to wear them in plain view at all times. Visitors and employees who presented at the building entrance without their issued ID badges were issued temporary visitors' badges good for that one day only and were required to wear them in plain view. In addition, employees were advised to arrive the following day with their previously-issued ID badges worn in plain view. All employees and visitors were subject to inspection of their personal effects.

## Handscoring Process

Writing prompts were evaluated on each of the five analytic traits and in accordance with Oklahoma's rubric. Using CTB/McGraw-Hill's Electronic Handscoring System (EHS), all writing responses were scored independently by two raters. The EHS employed an automated, random distribution of papers for first reads, second reads, and resolution reads across all readers designated to score that item. No student biographical or identifiable information was available to raters; all imaged items were scored as blind reads.

## Rater Reliability

Section 8 - Reliability and Validity describes the outcomes of inter-rater percentage of perfect and adjacent agreements. The inter-rater results for the operational writing prompts are presented in Tables 4.1 and 4.2 for English II and English III, respectively.

Table 4.1. Inter-rater Percentage of Perfect and Adjacent Agreement for English II

| Item | Form | Data <br> Point | Score <br> Points | \% of Agreement |  |  | Checkset <br> Average <br> Agreement <br> Percentages |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Perfect | Adjacent | Perfect <br> Adjacent |  |
| English II <br> II <br> Writing | A | A | 1-4 | 61.5 | 36.6 | 98.1 | 84.8 |
|  |  | B | 1-4 | 61.0 | 37.0 | 98.0 | 84.9 |
|  |  | C | 1-4 | 60.2 | 37.8 | 98.0 | 84.9 |
|  |  | D | 1-4 | 59.5 | 38.2 | 97.7 | 83.7 |
|  |  | E | 1-4 | 58.5 | 39.0 | 97.5 | 83.7 |
| English II Writing | B | A | 1-4 | 55.1 | 41.0 | 96.1 | 73.5 |
|  |  | B | 1-4 | 55.4 | 40.8 | 96.2 | 74.2 |
|  |  | C | 1-4 | 55.4 | 41.0 | 96.4 | 74.1 |
|  |  | D | 1-4 | 55.6 | 41.0 | 96.6 | 72.6 |
|  |  | E | 1-4 | 55.2 | 41.2 | 96.4 | 73.7 |
| English <br> II EQ <br> Writing |  | A | 1-4 | 67.4 | 31.2 | 98.6 | na |
|  |  | B | 1-4 | 64.4 | 34.8 | 99.2 | na |
|  |  | C | 1-4 | 61.5 | 37.0 | 98.5 | na |
|  |  | D | 1-4 | 60.0 | 38.6 | 98.6 | na |
|  |  | E | 1-4 | 60.0 | 38.6 | 98.6 | na |

Note: " $n a$ ": Too few documents distributed among multiple rating Supervisors to trigger EHS-generated checkset/validity papers.

Table 4.2. Inter-rater Percentage of Perfect and Adjacent Agreement for English III

| Item | Form | Data <br> Point | Score <br> Points | \% of Agreement |  |  | Checkset <br> Average <br> Agreement <br> Percentages |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Perfect | Adjacent | $\begin{array}{\|c\|} \hline \text { Perfect } \\ + \\ \text { Adjacent } \\ \hline \end{array}$ |  |
| English III <br> Writing | A | A | 1-4 | 63.5 | 35.2 | 98.7 | 83.1 |
|  |  | B | 1-4 | 63.0 | 35.6 | 95.6 | 83.2 |
|  |  | C | 1-4 | 62.0 | 36.4 | 98.4 | 82.6 |
|  |  | D | 1-4 | 61.4 | 36.8 | 98.2 | 81.8 |
|  |  | E | 1-4 | 60.8 | 37.4 | 98.2 | 82.0 |
| English <br> III <br> Writing | B | A | 1-4 | 61.9 | 36.2 | 98.1 | 79.9 |
|  |  | B | 1-4 | 62.0 | 36.0 | 98.0 | 80.1 |
|  |  | C | 1-4 | 61.6 | 36.6 | 98.2 | 80.7 |
|  |  | D | 1-4 | 61.5 | 36.4 | 97.9 | 80.8 |
|  |  | E | 1-4 | 60.3 | 37.4 | 97.7 | 80.2 |
| English <br> III EQ <br> Writing |  | A | 1-4 | 48.6 | 46.0 | 94.6 | na |

|  |  | C | 1-4 | 57.7 | 35.2 | 92.9 | na |
|  |  | D | 1-4 | 57.7 | 36.0 | 93.7 | na |
|  |  | E | 1-4 | 59.5 | 34.2 | 93.7 | $n a$ |

Note: $n a=$ Too few documents distributed among multiple rating Supervisors to trigger EHS-generated checkset/validity papers.

## Section 5 - Sampling Plan and Field Test Design

## Section 5.1 - Sampling Plan

A sample representative of the population of Oklahoma students was used for the Spring 2013 English II and English III post-equating because final scale scores and performance levels should be reported within two weeks of the closed testing window. Due to the reporting schedule, some students' data were prioritized in the scanning and scoring process and used throughout item level analyses, calibration, and equating. Once the data was available, CTB/McGraw-Hill Research conducted a data integrity check and compared the sample selection to the 2012 population to ensure that the sample was representative. Table 5.1 shows the Spring 2013 calibration samples by form used for post-equating of the English II and English III tests.

Table 5.1. English Calibration Sample for Spring 2013 and Respective Percentage of the Population

| English <br> II <br> Forms | Population | Sample <br> N <br> Counts | Percent | English <br> III <br> Forms | Population | Sample <br> N <br> Counts | Percent |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| AA | 9776 | 5844 | 60 | AA | 10096 | 5809 | 58 |
| AB | 9470 | 4849 | 51 | AB | 9579 | 5915 | 62 |
| BA | 8911 | 5528 | 62 | BA | 8556 | 5250 | 61 |
| BB | 8718 | 4416 | 51 | BB | 8554 | 5440 | 64 |

Table 8, in the Tables section, provides the proportion of students in the English II and English III samples and within the Spring 2013 population that came from each of the subgroups: gender, ethnicity, special population (ELL, IEP, Section 504, and accommodated), and socio-economic status (SES Low). SES Low is for students who have participated in the National School Lunch Program (NSLP). It is clear from these tables that the sample is also representative of the state's Spring 2013 population, even across most of the subgroups. The differences between the sample and the state tend to be less than $+/-5 \%$ with a median difference of 0.09 (absolute value).

No sampling decreases or increases were required since the sample received was well representative of the target or expected sample and therefore, representative of the population of students in Oklahoma.

## Section 5.2 - Field Test Design

New items are field tested to build up the item bank for future form selections. An embedded field test design was used in which newly developed field test items were embedded throughout the test. The advantage of an embedded field test design is that test-takers do not know where the field test items are located and therefore students' motivation for operational and field test items are the same. Table 5.2 shows the number of field test items for each content area. Ten to fifteen MC field test items per form were placed in common positions across all contents. Algebra I, Algebra II, and Geometry had 10 items each in the four field test forms per form A and B. Biology I had 15 items each in the three field test forms per form A and B. English II and

English III had 15 items each in the 4 field test forms per form combination (AA, AB, BA, BB). English II and III had some common field test items between field test forms. U.S. History had 15 items each in the five field test forms per form A and B. In total, across contents, there were 714 unique field test items.

Table 5.2 Number of Field Test Items for Each Content Area

| Content | N of FT <br> Forms | FT Items <br> per Form | Total |
| :--- | :---: | :---: | :---: |
| Algebra I | 8 | 10 | 80 |
| Algebra II | 8 | 10 | 80 |
| Biology | 6 | 15 | 90 |
| English II | 8 | 15 | 120 |
| English III | 8 | 15 | 120 |
| Geometry | 8 | 10 | 80 |
| U.S. History | 10 | 15 | 150 |
| Total |  |  |  |

## Section 5.3 - Data Receipt Activities

### 5.3.1 Suppressed/Omitted/Invalidated cases

Eliminate suppressed, omitted, and invalidated cases that were flagged in the WinScore files. Cases that had five or less valid attempts were eliminated as well.

### 5.3.2. Duplicate cases

Any duplicate cases were eliminated by checking student ID (if available), first and last name, middle initial, GIS_CD (GIS code normally containing the district and school ID), teacher name, school, birthday, gender, and response vectors.

### 5.3.3. Non-public schools

The non-public schools were excluded. Those schools are:

- Oklahoma School for the Deaf
- Oklahoma School for the Blind
- Riverside Indian School
- Sequoia Indian School
- Jones Academy

### 5.3.4 Second-timers

Students who took the test for the second time were excluded as well.

## Section 6 - OCCT Scaling and Equating Methods

The Winter 2012 OCCT EOI and Spring 2013 OCCT EOI programs were based on the application of pre-equating for Algebra I, Algebra II, Geometry and U.S. History; while postequating was applied to English II and English III. For Biology I, a new scale was set up and a standard setting was performed during Summer 2013.

Verification of the equating samples was described in Section 5 - Sampling Plan and Field Test Design. A series of item-level analyses were conducted. These analyses were highly scrutinized to confirm that score keys were accurately and systematically applied and that the summary statistics, such as the item difficulties ( $p$-values) and reliabilities (point biserial correlations), were comparable across administrations. CTB/McGraw-Hill Content Development completed a review of all items flagged for possible mis-keys and approved the score keys that were applied. The items were then scaled using the IRT models chosen for OCCT EOI: the three-parameter logistic (3PL) model for MC items and the two-parameter partial credit (2PPC) model for the writing prompts. The following section describes the IRT methods used in the analyses of the operational test items.

## Section 6.1 - Classical Item Analyses

## Item Level Analyses

Each Winter 2012 and Spring 2013 operational test item was first reviewed in terms of classical raw score statistics. Each item was reviewed for frequency distribution (number of students responding for each answer choice or score level), overall $p$-value (proportion of students choosing the correct answer), and point biserial or item-test correlation (how correlated each individual item is with the test as a whole based on the correct response). Typically, $p$-values should range between 0.25 and 0.90 . Items with a $p$-value less than 0.25 are considered more difficult because fewer than $25 \%$ of the students are achieving the correct answer. Values greater than 0.90 indicate a fairly easy item because more than $90 \%$ of students are achieving the correct answer. A small number of easy items are included to motivate low-performing students, and a small number of difficult items are included to motivate high-performing students. With newlytested content, the $p$-values may dip lower than 0.25 , at which point the item should be evaluated in light of the newness of content or students' opportunity to learn the content. Point biserials or item-test correlations are usually in the range of 0.30 and above, although some items can be acceptable when as low as 0.15 . The point biserials of each item's distractors, or incorrect responses, were also analyzed, as well as any distractor with a positive point biserial, either of which was reviewed for the possibility of an additional correct response or no correct response.

Item omit rate (percentage of students that didn't respond to an item) was also examined. Omitted items are scored as zero. The rate of omission often provides information about test speededness, particularly if there is a high omit rate on an item at the end of a test session. High omit rate on an item might also indicate other problems associated with the item such as an unclear question or a confusing presentation. When more than $5 \%$ of students omitted an item, the item was reviewed by both CTB/McGraw-Hill Research and Publishing.

A summary comparison of the classical statistics between the Spring 2011, Spring 2012, and Spring 2013 OCCT EOI results is presented in Table 9. Typically, differences less than about $|0.05|$ are desirable and, as can be seen, $p$-values and mean item-test correlation differences were within expectation.

A detailed summary of the item level classical raw score statistics and omission rates for Spring 2013 and a comparison to Spring 2012 are provided in Section 7-Results.

## Section 6.2 - Differential Item Functioning (DIF) Analysis

One of the goals of the OCCT EOI assessments is to assemble a set of items that provides a measure of a student's achievement that is as fair and accurate as possible for all subgroups within the population. Differential item functioning (DIF) analysis refers to statistical procedures that assess whether items are differentially difficult for matched-achievement students across reference and focal subgroups (the latter being the group of interest). DIF procedures typically control for overall between-group differences on a criterion, usually total test scores. Betweengroup performance on each item is then compared within sets of examinees having the same total test scores. If the item is differentially more difficult for an identifiable subgroup when conditioned on achievement, the item may be measuring something different from the intended construct. However, it is important to recognize that the flagging of items for DIF might be related to actual differences in relevant knowledge, skills or statistical Type I error. As a result, DIF statistics are used only to identify potential sources of item bias. Subsequent review by content experts and bias committees are required to determine the source and meaning of performance differences. OCCT EOI conducts DIF analyses across gender (males/females) and ethnicity- focal subgroups African American (not Hispanic), American Indian/Alaskan Native, and Hispanic versus the reference group White (not Hispanic).

The Mantel-Haenszel (MH) DIF statistic was used for the OCCT EOI operational tests. It matches students across the reference and focal groups based on their overall test performance and provides a chi-square to test whether the odds of answering an item correctly are similar for both the reference and focal groups. The items were classified into three categories on the basis of the MH DIF chi-square statistics and the MH delta $(\Delta)$ value of A, B, or C for either dichotomous or polytomous items (see Dorans \& Holland, 1993; Zieky, 1993; and Michaelides, 2008), where items classified as A are interpreted as having no DIF and items classified as C are interpreted as having potentially severe DIF. The item flag classifications are made as follows:

- The item is classified into the C category if MH DIF is significantly different from zero ( $p<0.05$ ), and the absolute value of MH delta is greater than or equal to 1.5 .
- The item is classified into the B category if MH DIF is significantly different from zero ( $p<0.05$ ), and the absolute value of MH delta is between 1.0 and 1.5.
- The item is classified into the A category if MH DIF is not significantly different from zero ( $p \geq 0.05$ ), or if the absolute value of MH delta is less than 1.0.

## Section 6.3 - Calibration \& Item Fit

Item Response Theory (IRT) Models

## IRT Models and Rationale for OCCT EOI Applications

Item response theory (IRT) allows comparisons between items and examinees, even those from different test forms, by using a common scale for all items and examinees (i.e., as if there were a hypothetical test that contained items from all forms). The three-parameter logistic (3PL) model (Lord \& Novick, 1968; Lord, 1980) was used to analyze item responses for the MC items. For analysis of the Constructed-Response (CR) items, the two-parameter partial credit model (2PPC) (Muraki, 1992; Yen, 1993) was used.

IRT is a statistical methodology that takes into account the fact that not all test items are alike and that all items do not provide the same amount of information in determining how much a student knows or can do. Computer programs that implement IRT models use actual student data to estimate the characteristics of the items on a test, called "parameters." The parameter estimation process is called "item calibration."

IRT models typically vary according to the number of parameters estimated. For the OCCT EOI tests, three parameters are estimated: the discrimination parameter, the difficulty parameter(s), and, for MC items, the guessing parameter. The discrimination parameter is an index of how well an item differentiates between high-performing and low-performing students. An item that cannot be answered correctly by low-performing students, but can be answered correctly by high-performing students, will have a high discrimination value. The difficulty parameter is an index of how easy or difficult an item is. The higher the difficulty parameter, the more difficult the item is. The guessing parameter is the probability that a student with very low ability will answer the item correctly.

Because the characteristics of MC and CR items are different, two IRT models were used in item calibration. The three-parameter logistic (3PL) model (Lord \& Novick, 1968; Lord, 1980) was used in the analysis of MC items. In this model, the probability that a student with ability $\theta$ responds correctly to item $i$ is

$$
\begin{equation*}
P_{i}(\theta)=c_{i}+\frac{1-c_{i}}{1+\exp \left[-1.7 a_{i}\left(\theta-b_{i}\right)\right]} \tag{1}
\end{equation*}
$$

where $a_{i}$ is the item discrimination, $b_{i}$ is the item difficulty, and $c_{i}$ is the probability of a correct response by a very low-scoring student.

For analysis of the CR items, the 2PPC model was used. The 2PPC model is a special case of Bock's (1972) nominal model. Bock's model states that the probability of an examinee with ability $\theta$ having a score $(k-1)$ at the $k^{\text {th }}$ level of the $j^{\text {th }}$ item is

$$
\begin{equation*}
P_{j k}(\theta)=P\left(x_{j}=k-1 \mid \theta\right)=\frac{\exp Z_{j k}}{\sum_{i=1}^{m_{j}} \exp Z_{j i}}, k=1 \ldots m_{j} \tag{2}
\end{equation*}
$$

where

$$
\begin{equation*}
Z_{j k}=A_{j k} \theta+C_{j k} \tag{3}
\end{equation*}
$$

and $k$ is the item response category $\left(k=1,2, \ldots m_{j}\right)$. The $m_{j}$ denotes the number of score levels for the $j^{\text {th }}$ item, and typically the highest score level is assigned $\left(m_{j}-1\right)$ score points. For the special case of the 2PPC model used here, the following constraints were used:

$$
\begin{equation*}
A_{j k}=\alpha_{j}(k-1) \tag{4}
\end{equation*}
$$

and

$$
\begin{equation*}
C_{j k}=-\sum_{i=0}^{k-1} \gamma_{j i} \tag{5}
\end{equation*}
$$

where,

$$
\begin{equation*}
\gamma_{j_{0}}=0, \tag{6}
\end{equation*}
$$

and $\alpha_{j}$ and $\gamma_{j i}$ are the free parameters to be estimated from the data.
Each item has $\left(m_{j}-1\right)$ independent $\gamma_{j i}$ parameters and one $\alpha_{j}$ parameter; a total of $m_{j}$ parameters are estimated for each item.

The IRT model parameters were estimated using CTB/McGraw-Hill's PARDUX software (Burket, 2002). PARDUX estimates parameters simultaneously for MC and CR items using marginal maximum likelihood procedures implemented via the expectation-maximization algorithm (Bock \& Aitkin, 1981; Thissen, 1982; CTB, 2011). Simulation studies have compared PARDUX with MULTILOG (Thissen, 1991), PARSCALE (Muraki \& Bock, 1991), and BIGSTEPS (Wright \& Linacre, 1992). PARSCALE, MULTILOG, and BIGSTEPS are among the most widely known and used IRT programs. PARDUX was found to perform as well as these other programs (Fitzpatrick, 1990; Fitzpatrick, 1994; Fitzpatrick \& Julian, 1996).

## Assessment of Item Fit to the IRT Model

## Item-Model Fit

Item fit statistics discern the appropriateness of using an item in the 3PL or 2PPC model. A procedure described by Yen (1981) was used to measure fit to the 3PL model. Students are rankordered on the basis of $\hat{\theta}$ values and sorted into ten cells with $10 \%$ of the sample in each cell. For each item, the number of students in cell $k$ who answered item $i, N_{i k}$, and the number of students in that cell who answered item $i$ correctly, $R_{i k}$, were determined. The observed proportion in cell $k$ passing item $i, O_{i k}$, is $R_{i k} / N_{i k}$. The fit index for item $i$ is

$$
\begin{equation*}
Q_{l i}=\sum_{k=1}^{10} \frac{N_{i k}\left(O_{i k}-E_{i k}\right)^{2}}{E_{i k}\left(1-E_{i k}\right)}, \tag{7}
\end{equation*}
$$

with

$$
\begin{equation*}
E_{i k}=\frac{1}{N_{i k}} \sum_{j / \text { cell } k}^{N_{i k}} P_{i}\left(\hat{\theta}_{j}\right) \tag{8}
\end{equation*}
$$

A modification of this procedure was used to measure fit to the 2 PPC model. For the 2PPC model, $Q_{1 j}$ was assumed to have approximately a chi-square distribution with the following degree of freedom:

$$
\begin{equation*}
d f=I\left(m_{j}-1\right)-m_{j}, \tag{9}
\end{equation*}
$$

where $I$ is the total number of cells (usually 10) and $m_{j}$ is the possible number of score levels for item $j$.

To adjust for differences in degrees of freedom among items, $Q_{1}$ was transformed to $Z_{Q 1}$ where

$$
\begin{equation*}
\mathrm{Z}_{Q_{l}}=\left(Q_{1}-d f\right) /(2 d f)^{1 / 2} . \tag{10}
\end{equation*}
$$

The value of $Z$ will increase with sample size, all else being equal. To use this standardized statistic to flag items for potential misfit, it has been CTB/McGraw-Hill's practice to vary the critical value for $Z$ as a function of sample size. For the OP tests, which have large calibration sample sizes, the criterion $\mathrm{Z}_{Q_{1}}$ Crit used to flag items was calculated using the expression

$$
\begin{equation*}
\mathrm{Z}_{Q_{l}} \text { Crit }=\left(\frac{N}{1500}\right) * 4 \tag{11}
\end{equation*}
$$

where $N$ is the calibration sample size.
Items were considered to have poor model fit if the value of the obtained $Z_{Q 1}$ was greater than the value of $Z_{Q 1}$ critical. If the obtained $Z_{Q 1}$ was less than $Z_{Q 1}$ critical, the items were rated as having acceptable fit.

## Section 6.4-Equating

## Test Scaling and Equating

Once all item-level analyses were conducted, each Spring 2013 OCCT EOI English II and English III form was calibrated and equated using the Stocking and Lord procedure (Stocking \& Lord, 1983), a standard method of equating a new test form onto an existing scale. The Stocking and Lord procedure is based on the test characteristic curve (TCC) from the anchor items, which were selected to be representative of reference forms and Spring 2013 operational forms by statistics and content. CTB PARDUX software was applied to equating (2011). The same process was applied to both Winter 2012 and Spring 2013 English II and English III. TCC and IRT standard error of measurement (SEM) plots showing the quality of the test equating for Spring 2013 OCCT EOI are found in Figures 19-36.

## Stability of Anchor Items

The stability of the anchor items is important for the equating procedure. The following method was applied to drop anchor items prior to equating:
1.) Items flagged using the TCC method are considered for exclusion when the correlation between the input and estimated item parameters is below 0.80 for the $a$-parameter and below 0.90 for the $b$-parameter. If the exclusion of an anchor outlier item increases the $a$ parameter correlation to above 0.80 or increases the $b$-parameter correlation to above 0.90 , then the anchor is a candidate for removal.
2.) An anchor is a candidate for removal when the item is flagged on four of the seven statistics considered when examining the severe differences between the IRT regression curves: Item characteristic curves (ICCs) for anchor items prior to and after equating.
3.) An outlier for $a$-parameter or $b$-parameter can be a candidate based on an anchor item plot, which shows the relationships of anchor item parameters before and after equating (Kolen \& Brennan, 2005).
4.) Removal of the item may not significantly alter the content distribution of the anchor set. The distribution of items across the content standards must remain within $10 \%$ of the test blueprint for the content area.
5.) The mean difference and standard deviation ratio are also referenced.
6.) It is important to recognize that differential item performance in two test administrations does not necessarily indicate item flaws and may be affected by population differences, differences in teaching strategies, curriculum changes, etc. Therefore, CTB/McGraw-Hill recommended that the Oklahoma SDE consider item content-related factors in addition to statistical evidence of differential item performance in two test administrations.

Items removed from the anchor set based on the flags from the evaluation procedure are still scored as part of the whole test. After an anchor item is removed from the anchor set based on the previous criteria, the anchor file needs to be adjusted and a second version of the calibration and equating must be produced. All outputs in the second version need to be evaluated following the same guidelines as the original calibration runs.

## Section 6.5 - Writing Test Scoring

Writing prompts were administered as a part of the English II and English III in the Winter 2012 and Spring 2013 administrations. The writing score is a weighted composite of five analytic scores that focus on specific domains of writing skills. The steps for calculating the English II Writing scores follow and are illustrated for an example in Table 6.1.

## Steps to Calculate OCCT EOI English II Writing Scores

STEP 1: Average the trait scores from the two raters to obtain each of the five analytic trait scores. Average the scores in Column C and Column D, and write the results in Column E.
STEP 2: Apply the weights to the trait scores. Multiply the numbers in Column B and Column E. Write the results in Column F.

STEP 3: Sum all the weighted trait scores in Column F (lower right corner).
STEP 4: Transform the sum of the weighted trait scores. That is, multiply the weighted sum of the trait scores by 1.7 and subtract 1.025 as shown following the table.
STEP 5: Round the transformed weighted composite score to the nearest whole number to obtain the final Writing score. After calculation, the final writing score value will range from 1 to 6 .
Table 6.1. Calculating Writing Composite Scores for English II

| A | B | C | D | E | F |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Analytic Traits | Weights | Trait Scores <br> from Rater 1 | Trait Scores <br> from Rater 2 | Average <br> $(\mathrm{C}+\mathrm{D}) / 2$ | Weighted Trait Scores <br> $(\mathrm{B} \mathrm{X} \mathrm{E})$ |
| Ideas and Development | 0.30 | 3 | 2 | $(3+2) / 2=2.5$ | $.30 \times 2.5=0.75$ |
| Organization, Unity, and Coherence | 0.25 | 3 | 3 | $(3+3) / 2=3.0$ | $.25 \times 3.0=0.75$ |
| Word Choice | 0.15 | 3 | 2 | $(3+2) / 2=2.5$ | $.15 \times 2.5=0.375$ |
| Sentences and Paragraphs | 0.15 | 2 | 3 | $(2+3) / 2=2.5$ | $.15 \times 2.5=0.375$ |
| Grammar/Usage and Mechanics | 0.15 | 3 | 2 | $(3+2) / 2=2.5$ | $.15 \times 2.5=0.375$ |
|  |  |  |  |  | Sum Above |

Transformed Writing Score $=2.625$ X 1.7-1.025 $=3.4375$
Final Writing Score $=3$
The steps for calculating the English III Writing scores follow and are illustrated for an example in Table 6.2.

## Steps to Calculate OCCT English III Writing Scores

The steps that follow show the calculation of the ACE English III Writing scores based on the trait scores for a writing prompt. The table shows an example of the calculation of the ACE English III Writing scores.

STEP 1: Average the trait scores from the two raters to obtain each of the five analytic trait scores. Average the scores in Column C and Column D, and write the results in Column E.

STEP 2: Multiply the weights by 5 to give new weights. Multiply the numbers in Column B by 5 , and write the results in Column F.

STEP 3: Multiply each trait score by the new weight to give the weighted score. Multiply Column E by Column F, and write the results in Column G.

STEP 4: Sum all the weighted scores in Column G (lower right corner).
STEP 5: Transform the sum of the weighted trait scores. Multiply the weighted sum of the trait scores by .58 and subtract 1.67843 as shown following the table.

STEP 6: Round the transformed score to the nearest whole number to obtain the final English III Writing score. After calculation, the final ACE English III Writing score value will range from 1 to 10 .

Table 6.2. Calculating Writing Composite Scores for English III

| A | B | C | D | E | F | G |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Analytic Traits | Weights | Trait Scores from Rater 1 | Trait Scores from Rater 2 | Average Trait $(\mathrm{C}+\mathrm{D}) / 2$ | New Weight (B X 5) | Weighted Trait Scores (E X F) |
| Ideas and Development | 0.30 | 2 | 2 | 2 | $(.30 \times 5)=1.5$ | $(2 \mathrm{X} \mathrm{1.5)}=3$ |
| Organization, Unity, and Coherence | 0.25 | 1 | 2 | 1.5 | $(.25 \mathrm{X} \mathrm{5})=1.25$ | $(1.5 \times 1.25)=1.875$ |
| Word Choice | 0.15 | 2 | 3 | 2.5 | $(.15 \times 5)=0.75$ | $(2.5 \mathrm{X} .75)=1.875$ |
| Sentences and Paragraphs | 0.15 | 3 | 3 | 3 | $(.15 \times 5)=0.75$ | $(3 \mathrm{X} .75)=2.25$ |
| Grammar/Usage and Mechanics | 0.15 | 4 | 3 | 3.5 | $(.15 \times 5)=0.75$ | $(3.5 \mathrm{X} .75)=2.625$ |
|  |  |  |  |  |  | Sum Above |
|  |  |  |  |  |  | 11.625 |

Transformed ACE English III Writing Score $=11.625$ x . $58-1.67843=5.06407$
Final Writing Score $=5$

## Section 7 - Results

This section provides the data analysis results for the Winter 2012 and Spring 2013 OCCT EOI. Item level analyses for operational and field test items are presented below. Standard, test, and proficiency level student performances are summarized and presented as well. Three MC items were suppressed in the OCCT EOI Spring 2013 operational tests, due to their extremely poor item statistics. One item in English II form B, one item in English III forms A and B, and one item in U.S. History form B were suppressed in Spring 2013. These suppressions were approved by the SDE. The suppressed items did not contribute to students' scores and are not included in the analyses results in this section.

## Section 7.1 - Item Level Performance

A summary comparison of the classical item statistics between the Spring 2011, Spring 2012, and Spring 2013 OCCT EOI is presented in Table 9. Typically, differences of less than about $|0.05|$ are expected. As can be seen in Table 9, item $p$-values had a slight increase across grades and content areas, with the largest difference seen in Biology I and English III ( 0.05 ) between Spring 2012 and Spring 2013. The mean item-test correlation differences range from -0.01 to 0.01 , except for U.S. History (0.02).

A summary of the range of $p$-values and item-test correlations of all operational and field test items for Spring 2013 is presented in Table 10. (Item-test correlations were calculated by correlating the correct response of the focal item to the remainder of the items in the test, focal item excluded.) As shown in Table 10, the average $p$-values for the operational test items are in the mid 0.60s for Algebra I, low 0.60s for Algebra II, high 0.60s for Biology I, mid 0.70s for English II, high 0.60 s to low 0.70 s for English III, around 0.70 for Geometry, and in the mid 0.60 s for U.S. History. The range of the $p$-values dips below 0.25 in Algebra I and English III for all forms. Item-test correlations across content areas for operational items are within typical and acceptable ranges. For Biology I form B and most forms in English II and English III, one or more items show item-test correlation lower than 0.15 . For the field test items, the average $p$ values for the items are in the low and mid 0.50s for Algebra I, low 0.50s for Algebra II, low to mid 0.50s for Biology I, low to mid 0.60s for English II, around 0.60 for English III, low to mid 0.50 s for Geometry, and mid to high 0.50 s for U.S. History. Average item-test correlations for field test items are in the low to mid 0.30 s for most content areas.

The item omission rates for operational and field test items are presented in Table 11. The operational items show less than $0.85 \%$ (well below the $5 \%$ criteria) omission rate across contents, indicating acceptable administration times for the number of items in each test session. The MC field test items for all contents show omission rates well below the $5 \%$ criteria.

The Spring 2013 OCCT EOI DIF results are reported for all contents in Table 12 for gender and Tables 13 and 14 for ethnicity. There were no items flagged for moderate or severe DIF for the American Indian/ Alaskan Native subgroup in either operational or field test items. The results indicate that the majority of operational test items did not exhibit potential bias. For operational items on gender DIF, there were a total of 35 items (5.1\%) flagged for moderate "B" DIF and 13 items (1.9\%) flagged for severe "C" DIF. For operational test items in the African American (not

Hispanic) and Hispanic ethnicity groups included in the DIF analyses, there were respectively $3.5 \%$ and $2.6 \%$ of the items flagged for moderate "B" DIF, and $0.7 \%$ and $0.6 \%$ of the items flagged for severe "C" DIF.

DIF results for the field test in all contents for gender DIF show that there were a total of 35 items (5\%) flagged for moderate "B" DIF and 2 items ( $0.3 \%$ ) flagged for severe "C" DIF. For field test items in the African American (not Hispanic) and Hispanic ethnicity groups included in the DIF analyses, there were respectively $4.9 \%$ and $2.6 \%$ of the items flagged for moderate " B " DIF, and $0.07 \%$ and $0.4 \%$ of items flagged for severe "C" DIF.

All of the items flagged were reviewed by CTB/McGraw-Hill content experts who crossreferenced all teacher judgments and comments from across the content reviews, bias and sensitivity reviews, as well as alignment workshops to make decisions with the SDE about suppressions from operational scoring and use of the flagged operational and/or field test items in future test forms. No Spring 2013 operational items were suppressed due to DIF.

## Items with Poor Statistics

Piloting or field testing items is the best way to find potentially problematic items in the item pool. However, even during an operational administration, there are times that items become unstable or do not exhibit the highest expected qualities. Therefore, the evaluation of items across administrations from the content reviews, bias and sensitivity reviews, alignment workshops, and the various statistical analyses can be exhaustive and sensitive to the test blueprints, which can sometimes result in the suppression of some operational items from student scores and of some field test items from the item pool. Sometimes, OE items that do not show enough/adequate case counts at a given score level, resulting in score collapses, and items that do not converge during scaling or that exhibit extreme misfit are also suppressed.

During the Spring 2013 OCCT EOI operational and field test administration, items were reviewed for their classical statistics, and when those statistics were outside the range of difficulty ( $p$-values less than 0.25 or greater than 0.90 ) or showed low item-test-correlations (less than 0.15 ) for a specific item, the item was used or kept as a "good item" in the pool only when the content of the item justified its use (e.g., it was a new standard or new approach that was expected to be difficult). For the Spring 2013 OCCT EOI operational test, three items were suppressed before scoring began. Items with less than desirable $p$-values and item-test correlations were reviewed by CTB/McGraw-Hill content experts and Research, and field test items considered to have less than desirable statistics were suppressed from the item pool.

## Section 7.2 - Performance at Standards Level

A review of the item difficulty across standards within each content area is provided to illustrate for which standards items were more or less difficult for students. The summaries are presented in Tables 15-20. The tables provide the number of operational items, the reliability (coefficient alpha) and the standard error of measurement (SEM) (See Section 8-Summary of Reliability and Validity), and the average difficulty or IRT location ( $b$ parameter) value. The tables also provide the average $p$-values for the state and for each proficiency level for each standard.

As shown in Tables 15-20, the reliability at each standard, which is influenced by the number of items contributing to each standard, ranges from 0.54 to 0.86 in Algebra I, from 0.57 to 0.85 in Algebra II, from 0.45 to 0.79 in Biology I, from 0.31 to 0.68 in English II, from 0.45 to 0.77 in English III, from 0.47 to 0.83 in Geometry, and from 0.54 to 0.77 in U.S. History. Across the content areas, the standard errors are no greater than 2.43 and the maximum amount of IRT information is about 0.66 .

IRT locations and $p$-values should be reviewed within each content area by standard shown in Tables 15-20. The IRT scale locations provide an indication of the average $b$ parameters or location values of the set of items contributing to each of the standards. Different from the average $p$-values, the IRT locations provide information on the location of the items along the scale score continuum, such that higher values indicate a higher probability for a student with estimated higher ability to answer those items correctly. The $p$-values provide only the proportion of students in each group answering the items correctly, averaged across items within each of the standards.

## Section 7.3 - Test Level Performance

## Total Group Scale Scores

The Spring 2013 OCCT EOI applies a number-correct to scale score scoring method based on the 3PL IRT model. In this method, all students who have the same raw score get the same scale score regardless of which items are correct.

Tables 21 to 23 provide the state-level distribution of the scale scores across grades and content areas for Spring 2012, Winter 2012, and Spring 2013, respectively. Tables 22 and 23 provide the state-level distribution of the scale scores across grades and content areas as well as the distribution across the 25th, 50th, and 75th percentiles for Winter 2012 and Spring 2013. (Spring 2013 scale score reliability as coefficient alpha and standard error of measurement are also provided and further explained in Section 8-Summary of Reliability and Validity.) Provided as a reference only, Table 21 shows those results for Spring 2012. Histograms and associated skewness and kurtosis of the data for Spring 2013 are provided in Figures 1-18. The data are close to normally distributed with a very minimal positive skew in most content areas and grades.

## Subgroup Scale Scores and Mean Differences

Subgroup-level scale score performance data (scale score means and standard deviations, minimum and maximum scale scores, reliability and standard error of measurement) are provided along with state-level data in Table 24 for Winter 2012 and in Table 25 for Spring 2013. For Spring 2013, mean differences were subjected to independent sample $t$-tests for gender, IEP, Low SES, ELL, Section 504, and accommodated students subgroups, in each content area. One way Analysis of Variance (ANOVA) tests were conducted across ethnicities, for which equal variances were not assumed and the level of significance was set at 0.05 . Spring 2013 results of the $t$-tests and ANOVA are found in Tables 26-31 and Table 32, respectively.

As shown in Table 26, females outperform males in all forms in English II and English III as well as in Algebra I in both forms, and Algebra II and Geometry in form A; males outperform females in Algebra II form B, Geometry form B, Biology I in both forms, and U.S. History both forms. Mean differences are not statistically significant for Geometry form B only.

Results of the $t$-tests within each category indicate that IEP, Low SES, ELL, and accommodated students all score significantly lower than the rest of the population in all content areas (ranging from 15 to 103 fewer scale score points), as expected. IEP and ELL students tend to have the lowest performance of the "special population" subgroups. For the Section 504 group, the same is true in all content areas, but the mean differences compared with the rest of the state are less than 22 scale score points and not significant at most contents and forms, except Algebra I form B and English II from AB.

Statistically significant differences exist between the ethnicity groups in all content areas and grades as presented in the ANOVA results in Tables 32.

In comparing ethnicities across all content areas, students identified as Asian and White tended to outperform the other ethnicities in Spring 2013. A post-hoc Dunnett's C pair-wise comparison analysis was conducted to identify potential pairs of significant differences ( $p=0.05$ ), the results of which are found in Table 33. As shown in Table 33, Asian outperformed all other ethnicities in Algebra I and II, Biology I, and Geometry as well as most other ethnicities in English II and English III and U.S. History, with the exception of Pacific Islander, White, and the Other subgroup. White outperformed most other ethnicities, except Asian, in most content areas. Most pairs were significantly different with some exceptions, which were not significant, between African American, Native American, Hispanic, Pacific Islander, White and the Other subgroups. For example, White mean differences were not significantly different from Other subgroup in Algebra I forms A and B; and Pacific Islander in Biology I form B, Geometry form B, and U.S. History forms A and B, English II all forms, and English III forms AA, BA, and BB.

## Section 7.4 - Proficiency Level Performance

Table 7.1 shows the Spring 2013 scale score cut points for each proficiency performance level and the scale bounds. The lowest obtainable scale score (LOSS) and highest obtainable scale score (HOSS) values are shown for all content areas.

Table 7.1 Spring 2013 Scale Score Cuts and Scale Bounds

| Content Area | LOSS | Cut1 | Cut2 | Cut3 | HOSS |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Algebra I | 490 |  |  | 762 | 999 |
| Algebra II | 440 | 654 | 700 | 783 | 999 |
| Biology I | 440 | 651 | 700 | 773 | 999 |
| English II | 440 | 609 | 700 | 817 | 999 |
| English III | 440 | 670 | 700 | 802 | 999 |
| Geometry | 440 | 635 | 700 | 777 | 999 |
| U.S. History | 440 | 627 | 700 | 773 | 999 |

Table 34 shows the scale score means and standard deviations for the state and for students in each proficiency level. Table 35 provides the statewide distribution (or "impact data") of students within each proficiency level (Unsatisfactory, Limited Knowledge, Proficient, and Advanced) and the overall pass rates defined as the total percentage of students in both the Proficient and Advanced proficiency levels for Spring 2013. Tables 34 and Table 35 do not include the number of students considered Undetermined (invalid) in the denominator of the calculation.

Impact data across proficiency levels are also provided for each gender, ethnicity, and special population subgroups in Table 36, where comparative performance across subgroups mimics what was provided for the scale score descriptions.

## Section 8 - Summary of Reliability and Validity

This section summarizes some of the evidence in the earlier sections and provides additional evidence to support the degree to which the OCCT EOI tests are reliable and valid.
For the OCCT EOI, several measures of reliability are available. First, the tests are administered in standard fashion to all students. When students needed accommodations, such accommodations were provided with specific guidance from the OSTP 2012-2013 Test Preparation Manual (http://ok.gov/sde/sites/ok.gov.sde/files/documents/files/2705543W_tpm_w13OK.pdf). The General Guidance section describes details about the tests as well as specific administration policies, procedures, and accommodation guidelines.

## Section 8.1 - Item Level Reliability

Item-specific reliability statistics include inter-rater reliability, item-test correlations, and differential item functioning (DIF) or item bias. The inter-rater reliabilities of OE items rely heavily on the solid and consistent training of the Handscorers, as described in Section 4 Scoring. Tables 4.1 and 4.2, for English II and English III, respectively, provide the relevant inter-rater statistics, which are presented in terms of the percentage of perfect and adjacent agreement and checkset average agreement.

The point biserial, or item-test correlation, is one measure of reliability, computed using the correlation between each item and the overall test. We discussed the item-test correlation in Section 6 and in Section 7. The item-test correlations for each content area and item type are shown in Table 37. The operational item correlations ranged from 0.17 to 0.58 (Algebra I), from 0.19 to 0.55 (Algebra II), from 0.12 to 0.54 (Biology I), from 0.11 to 0.58 (English II), from 0.06 to 0.62 (English III), from 0.22 to 0.64 (Geometry), and from 0.15 to 0.57 (U.S. History). Several items in the Spring 2013 operational OCCT EOI presented item-test correlation less than 0.15 . Those items were investigated by Content Development for scoring key errors and found to be correctly scored. Any operational items with extremely low point biserial that may remain in the OCCT EOI item pool will be avoided on future operational forms.

DIF statistics (described in Section 6 - Methods and Section 7 - Results) provide a measure of the systematic errors by subgroups that are specifically attributed to potential bias or systematic over- or under-representation of subgroup performance when compared to total group performance. As shown in Tables 12-14 (last rows), the percentage of operational items that exhibited DIF at the moderate and severe levels was about $7.0 \%$ for gender and between $0.6 \%$ and $3.5 \%$ for the two ethnicity groups.

## Section 8.2 - Test Level Reliability

Total test reliability statistics (alpha and conditional standard errors of measurement, CSEMs) measure the level of consistency (reliability) of performance over all test questions in a given form, the results of which imply how well the questions measure the content domain and could continue to do so over repeated administrations. Total test reliability coefficients, measured by Cronbach's alpha (Cronbach, 1951) range from 0.00 to 1.00 , where 1.00 refers to a perfectly reliable test. The OCCT EOI reliability data are based on the Oklahoma student population and
the results for 2013 are typical of the results obtained for all previous OCCT EOI operational tests. The total test reliabilities of the operational forms were evaluated first by Cronbach's alpha (1951) index of internal consistency. The specific calculation for Cronbach's alpha, $\alpha$, is

$$
\begin{equation*}
\hat{\alpha}=\frac{k}{k-1}\left(1-\frac{\sum \hat{\sigma}_{i}^{2}}{\hat{\sigma}_{X}^{2}}\right), \tag{12}
\end{equation*}
$$

where $k$ is the number of items on the test form, $\hat{\sigma}_{i}^{2}$ is the variance of item $i, \hat{\sigma}_{X}^{2}$ is the total test variance, and the summation is over all the items $(i=1, \ldots, k)$ on the test. Achievement tests are typically considered of sound reliability when their reliability coefficients are in the range of 0.80 and above.

Table 38 shows the reliability coefficients for each scored operational test form for each content area and grade for both Spring 2012 and Spring 2013. The alpha reliability coefficients for Spring 2012 and Spring 2013 are quite similar. The reliability coefficients for Spring 2013 ranged between 0.86 (English form BA ) and 0.93 (Geometry form A). Such a range is indicative of the high reliability of the Spring 2013 OCCT EOI operational tests. As is evident in Table 25, for Spring 2013 state and subgroup data, the coefficients are quite high and similar to the state values, even at the subgroup levels. The mean of the state-level reliability coefficients for each content area in Table 38 are as follows: 0.91 (Algebra I), 0.90 (Algebra II), 0.89 (Biology I), 0.87 (English II), 0.88 (English III), 0.92 (Geometry), and 0.90 (U.S. History). At the subgroup level in Table 25, the lowest reliability (0.76) was found for the Section 504 students in English II form BA.

The SEM is another measure of reliability and is a direct estimate of the degree of measurement error in students' total scores (per the alpha reliability coefficient). The SEM represents the number of score points about which a given score can vary, similar to the standard deviation of a score; the smaller the SEM, the smaller the variability of the estimate, and the higher the reliability. The total SEMs are computed with the following formula:

$$
\begin{equation*}
S E M=S D_{-} T T(\sqrt{1-\hat{\alpha}}), \tag{13}
\end{equation*}
$$

where $S D_{\_} T T$ is the standard deviation for the total test and $\hat{\alpha}$ is the result of the calculation of Cronbach's $\alpha$ in Equation 12.

The CSEMs conditional on each scale score are computed with the following formula:

$$
\begin{equation*}
C S E M=S D_{-} S S(\sqrt{1-\hat{\alpha}}) \tag{14}
\end{equation*}
$$

$S D \_S S$ is the standard deviation of the scale score. The total test SEMs for each test form are provided for each content area and grade at the state and subgroup levels in Table 25. Scale score specific SEMs are given in Tables 39-43, which also provide the raw scores associated with each scale score.

## Section 8.3 - Test Level Validity

Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA) were conducted to investigate potential evidence to further support the validity of the OCCT EOI test scores for the total population and then for the accommodated, ELL, and IEP subgroups. The subgroups were chosen such that the students within each group may have characteristics that could contribute to issues of access and/or for whom the test measures construct irrelevant variances. A variety of criteria are used conjunctively to evaluate the assumption that each test for each content area measures a single (unidimensional) construct (e.g., Algebra I, English II, U.S. History). In factor analyses, the "construct" is referred to as a factor. The analyses help to organize the data such that relationships defined as factors are illuminated. If the data are essentially unidimensional, a single factor should account for most of the variation in the data.

Accordingly, a unidimensional factor model was tested using polychoric correlation coefficients against the obtained covariance matrix using maximum likelihood estimation (Bentler \& Bonett, 1980, Jöreskog, \& Sorbom, 1989) for each content area and grade for the total population and each subgroup using SAS version 9.1. The polychoric correlation is most appropriate when variables are dichotomous or ordinal and together are assumed to reflect a single, underlying construct (Byrne, 1998).

First, the factorability of the correlation matrix was examined before conducting the CFA (Is the data adequately correlated and thus analyzable or "factorable" to move forward?). The KaiserMeyer Olkin (KMO; Kaiser, 1970, 1974) measure of sampling adequacy was used through an EFA procedure to evaluate the strength of the linear relationship among the items within each correlation matrix. KMO values in the 0.90 and greater range are considered "marvelous" according to Kaiser's (1974) criteria. As shown in Table 44 and Table 45, KMO values for the total group ranged from 0.95 to 0.98 , and for each subgroup: from 0.86 to 0.95 (Accommodated), from 0.61 to 0.92 (ELL), and from 0.84 to 0.95 (IEP). That most of the KMO values are in the "marvelous" range suggests that the matrix is appropriate for CFA for each analysis.

As a rough estimate of the number of factors (dimensions or constructs) that might be present in the data, the Kaiser criterion of computing the eigenvalues for the correlation matrix was examined next. Eigenvalues represent how much variability is accounted for by each factor not in sum but out of the total amount of variance. Table 44 and Table 45 also show the total amount of variance that exists in each form, as well as the percentage of variance accounted for by the initial eigenvalue. For the total group analyses, the first eigenvalue's measure of the amount of variance in relation to the total variance is 91 and $89 \%$ (Algebra I), 91 and $95 \%$ (Algebra II), 97 and $99 \%$ (Biology I), 87-91\% (English I), 72-91\% (English III), 88 and $91 \%$ (Geometry), and 98 and $99 \%$ (U.S. History) respectively. The range of variance by the first eigenvalue in each content area and subgroup is as follows:

- Accommodated: $79 \%$ and $67 \%$ (Algebra I), $75 \%$ and $59 \%$ (Algebra II), $79 \%$ and $62 \%$ (Biology I), 52-60\% (English II), 52-71\% (English III), $81 \%$ and $73 \%$ (Geometry), and $80 \%$ and $65 \%$ (U.S. History).
- ELL: 70\% and 63\% (Algebra I), 52\% and 41\% (Algebra II), 63\% and 44\% (Biology I), 3235\% (English II), 27-30\% (English III), 66\% and 59\% (Geometry), and 58\% and 41\% (U.S. History).
- IEP: $77 \%$ and $70 \%$ (Algebra I), $75 \%$ and $67 \%$ (Algebra II), $79 \%$ and $65 \%$ (Biology I), 49-60\% (English II), 55-73\% (English III), $81 \%$ and $76 \%$ (Geometry), and $80 \%$ and $67 \%$ (U.S. History).

Such values indicate one major factor is present in each of the content assessments. It is interesting to note that the range of variance for the total population for U.S. History is mostly higher than the other content areas. At the subgroup level, the variance is higher for accommodated and IEP in Geometry and for ELL in Algebra I.

As a rule, "essential unidimensionality" is assumed when the ratio of the first eigenvalue to the second eigenvalue is at least three. The final column of Tables 44 and 45 provides the ratio of the first and second eigenvalues. All grades and content areas for the total population and each subgroup have no ratios less than three; therefore, the OCCT EOI tests demonstrate essential unidimensionality per the eigenvalue ratio criterion.

An additional available criterion used in EFA to judge the number of factors present is the scree test (Cattell, 1966) of eigenvalues plotted against factors. Examination of the scree plots (Figures 37-108) for the content areas for the total population and each subgroup indicates a single factor model is present and similar patterns between the total population and subgroups.

Summary inspection across all the criteria-variance, ratio of eigenvalues, and scree plotsseems to indicate that the tests for each content area and grade, and for each subgroup, are essentially unidimensional. It is important to review the relationships of factors in conjunction with all other data, particularly where items may be dependent (for example, where several items share a passage or stimulus).

## Section 8.4 - Performance Level Reliability

## Proficiency Level Reliability

One of the cornerstones of the federal Elementary and Secondary Education Act (ESEA) emphasizes the need for all students to score in the "Proficient" category on English Language Arts, Mathematics and Science. Because of a heavy emphasis on moving all students to or above the "Proficient" category, the consistency and accuracy of the classification of students into these proficiency categories is of particular interest. The statistical quality of cut scores that define the proficiency levels in which students are classified based on their performance serves as additional validity evidence. Details about the OCCT standard setting workshop and the Bookmark Standard Setting Procedure used to set the cut scores are given in the Oklahoma School Testing Program Bookmark Standard Setting Technical Report for End-of-Instruction Biology I (CTB/McGraw-Hill, 2013). The Bookmark Procedure (Mitzel, Lewis, Patz, \& Green, 2001) is a well-documented and highly regarded procedure that has been demonstrated by independent research to produce reasonable cut scores on tests across the country.

It is also important to review the specific scale score SEM for each cut score. Table 46 shows the Spring 2013 SEMs estimated for each of the cut scores for each content area and grade.
Comparison of the SEMs for the cut scores to the SEMs associated with other OCCT EOI scale scores for each test (shown in Tables 39-43) reveal that the SEMs for the cut scores are almost always among the lowest, which means that the OCCT EOI tests tend to measure most accurately near the cut scores. This is a desirable quality when cut scores are used to classify examinees. (Not every scale score possible, sometimes including the cut score, is shown in Tables 39-43; there are more scale scores possible at each raw score than can be shown in these tables.)

Not only it is important that the amount of measurement error around the cut scores be minimal; but it is also important to have the expected consistency with which students would be classified into performance levels if a test were given on repeated occasions.

Classification consistency is defined as the extent to which two classifications of a single student agree from two independent administrations of the same test (or two parallel forms of the test). Classification consistency and accuracy are additional measures of test reliability as well as validity. Reliability coefficients, such as Cronbach's alpha, are used to check for the internal consistency within a single test. Test-retest reliability requires two administrations of the same test, which requires another test as an external reference. Consistency in the classification sense represents how well two forms of an assessment with equal difficulty agree (Livingston \& Lewis, 1995). It is estimated using actual response data and total test reliability from an administered form of an assessment, from which two parallel forms of the assessment are statistically modeled and classifications compared.

Classification accuracy is defined as the agreement between the actual classifications using observed cut scores and true classifications based on known true cut scores (Livingston \& Lewis, 1995). It is common to estimate classification accuracy by utilizing a psychometric model to find true scores corresponding to observed scores.

In other words, classification consistency refers to the agreement between two observed classification results, while classification accuracy refers to the agreement between the observed classification outcome and the true classification result. A straightforward approach to classification consistency estimation can be expressed in terms of a contingency table representing the probability of a particular classification outcome under specific scenarios. For example, the following is a contingency table of $(\mathrm{H}+1) \times(\mathrm{H}+1)$, where H is the number of cut scores such that two cut scores yield a $3 \times 3$ contingency table below.

|  | Level 1 | Level 2 | Level 3 | Sum |
| :---: | :---: | :---: | :---: | :---: |
| Level 1 | $\mathrm{P}_{11}$ | $\mathrm{P}_{21}$ | $\mathrm{P}_{31}$ | $\mathrm{P}_{\cdot 1}$ |
| Level 2 | $\mathrm{P}_{12}$ | $\mathrm{P}_{22}$ | $\mathrm{P}_{32}$ | $\mathrm{P}_{.2}$ |
| Level 3 | $\mathrm{P}_{13}$ | $\mathrm{P}_{23}$ | $\mathrm{P}_{33}$ | $\mathrm{P}_{\cdot 3}$ |
| Sum | $\mathrm{P}_{1 .}$ | $\mathrm{P}_{2 .}$ | $\mathrm{P}_{3 .}$ | 1.0 |

To report classification consistency, Swaminathan, Hambleton, and Algina (1974) suggest using Cohen's kappa (1960):

$$
\begin{equation*}
\text { kappa }=\frac{P-P_{c}}{1-P_{c}}, \tag{15}
\end{equation*}
$$

where $P$ is defined as the sum of the diagonal values of the contingency table (the values shaded in the above table), and $P_{c}$ is the chance probability of a consistent classification under two completely random assignments. This probability, ${ }^{{ }_{c}}$, is the sum of the probabilities obtained by multiplying the marginal probability of the first administration and the corresponding marginal probability of the second administration:

$$
\begin{equation*}
P_{c}=\left(\mathrm{P}_{1} \times \mathrm{P}_{\cdot 1}\right)+\left(\mathrm{P}_{2} \times \mathrm{P}_{\cdot 2}\right)+\left(\mathrm{P}_{3 .} \times \mathrm{P}_{\cdot 3}\right) . \tag{16}
\end{equation*}
$$

The Livingston and Lewis (1995) method, based on the binomial error model and the fourparameter beta true score distribution, was applied to OCCT EOI. Tables 47 and 48 show the classification consistency and classification accuracy indices. The values of all indices depend on several factors, such as the reliability of the actual test form, the distribution of scores, the number of cut scores, and the location of each cut score. The probability of a correct classification (Consistency) is the probability that the classification the student received is consistent with the classification that the student would have received on a parallel form; in other words, that the classification is correct. This is akin to the exact agreement rate in inter-rater reliability, and the expectation is that this probability would be high.

Table 47 shows that the average consistency is 0.73 across content areas and ranges from 0.64 (Biology I form B) to 0.78 (English III form BB). The average accuracy is 0.80 across all content areas and ranges from 0.73 (Biology I form B) to 0.84 (English III form BB). Cohen's kappa (Kappa) provides the same type of reliability or agreement statistic as in the inter-rater reliabilities. In this context, it represents the agreement of the classifications between the two parallel forms with consideration of the probability of a correct classification by chance (Consistency-Chance $\left.{ }^{1}\right) /(1$-Chance). In general, the value of Kappa is lower than the value of Consistency because the probability of a correct classification by chance is greater than zero. This is true of the OCCT EOI data in Table 47. The average Kappa is 0.58 over all content areas and ranges from 0.51 (Biology I form B) to 0.63 (Geometry form A).

Consistency and accuracy are important to consider together. The probability of accuracy (Accuracy) represents the agreement between the observed classification, based on the actual test form, and true classification given the modeled form. Table 48 shows consistency and accuracy at the cut score level. The average consistency across content areas and cut score levels is 0.91 , ranging from 0.85 (Biology I form B, at the Proficient and Advanced proficiency levels) to 0.99 (English II both forms, at the Unsatisfactory and Limited Knowledge proficiency levels). The average accuracy across content areas and cut score levels is 0.93 , ranging from 0.89 (Biology I form B, at the Proficient and Advanced proficiency levels) to 0.99 (English II both forms, at the

[^0]Unsatisfactory and Limited Knowledge proficiency levels). Finally, Table 49 provides the probability of false positives (FP) and false negatives (FN) as measures of error in the data table, and these are low (no greater than 0.06 ), as expected.

## Section 9 - Online Disruption in Spring 2013 Administration

## Background

Online testing was administered to all Oklahoma OCCT EOI tests in the Spring 2013 administration. While the online testing window started in mid-April and was progressing well, on Monday, April $29^{\text {th }}$ and Tuesday, April $30^{\text {th }}$, students taking online assessments in the state experienced system interruptions, which led some local districts to temporarily suspend testing on those days. CTB's diagnostic efforts revealed that two separate issues with CTB/McGrawHill's Online Assessment System (OAS) caused the interruptions.

CTB/McGraw-Hill utilizes industry standard tools and current state software engineering practices for building and evaluating our systems. In preparation for the 2013 testing season, additional capacity was added and extensive load testing was performed. However, the factors that triggered the system interruptions on April $29^{\text {th }}$ and $30^{\text {th }}$ had not been detected in testing or prior year production use.

The key difference between what was seen in actual use versus CTB's performance evaluation was high utilization sustained over a longer period of time, which consumed more physical memory in the first outage and subsequently more virtual memory in the second. This memory utilization was more than the load tests predicted.

CTB engineers worked quickly to address both issues. In the first event, CTB restarted systems and added physical memory. In the second event, CTB identified necessary memory configuration changes and implemented them as rapidly as possible to allow the testing to continue. Changes included increased physical memory on nodes hosting applications, increased virtual memory Heap size on each node, and finally after analyzing utilization, adding more nodes on the following weekend. Once all these upgrades were completed, the OAS application was able to manage the volume of requests without degraded performance.

On April $30^{\text {th }}$, while CTB engineers were trying to restore the system health back to normal, one of the activity was to "cut over" to the disaster recovery site. While the system remained accessible, this "cut over" caused interruptions for almost all students who were active in the system. Also, as the system was moved from the working servers to the disaster recovery servers, some student responses were not immediately accessible to students when they logged back into that test session. All of the students' responses had been saved, but they were not immediately available due to the time it takes for the disaster recovery systems to be synchronized with live testing data from the primary servers. Based on the severity of the interruption and a recommendation, the State Superintendent requested that students complete their current test and then schools suspend online testing. For OCCT EOI testing, some students who were taking operational forms switched to an alternate operational form or equivalent form. On May $1^{\text {st }}$, online testing returned to normal, and students did not experience further interruptions.

## Section 9.1 - Interruption Study

The SDE requested an independent third-party study to investigate the impact of the disruptions on the test scores, and HumRRO was selected by the SDE to perform the study. Technical Advisory Committee (TAC) consists of researchers and assessment experts selected by the SDE. TAC members participated in a conference call with HumRRO researchers to recommend a design for the disruption study.

HumRRO applied several different methods using propensity matching between disrupted students and non-disrupted students and linear regression. Their study indicated that in general, students appeared to do as well on the test regardless of disruptions in testing (For detailed description, see "A Statistical Investigation of Oklahoma Computer Disruptions" in Appendix B).

## Section 9.2 - Actions for Disrupted Students

There were two types of disruption issues: 1) There were students whose performance was considered to be impacted and 2) There were students whose immediate scores (displayed on the online test delivery client when the test is finished) and two-week scores were different.

For the first issue, the SDE decided on retaining all scores of impacted students who scored Proficient or Advanced. Though students as a whole did not experience depressions in scores, the SDE wanted no lasting effect on student performance. Also, the SDE decided to not report scores for impacted students who scored Limited Knowledge or Unsatisfactory. Though the HumRRO study suggested no systematic impact of the disruption on test scores, in the event a particular student was impacted, not reporting the scores would ensure that the individual student was not wrongly scored. The SDE selected this approach for the benefit of the students and schools.

For the second issue, about 1,400 students received an immediate raw score that differed from the score they received on the two-week preliminary reports. Several factors contributed to this issue, one of which was caused by local sites downloading the wrong test system, and the other where it appears that during a short time-span on the second day of the interruptions (4/30), some of the student responses were not saved for inclusion in the two-week reports. Students received the higher of the two scores, the immediate and the two-week report scores. Students with higher immediate raw scores received a letter from CTB indicating their proficiency level. They were included in the report card, but not in the school or district summary report. Students with a higher two-week score received a traditional score report that included performance level and performance by content standard.

## Appendices

## Appendix A

Standards, Objectives/Skills, and Processes Assessed by Subject
Table A1. OCCT Test Blueprint and Actual Item Counts: Algebra I

| OKC ${ }^{3}$ Standard and Objective | Ideal Number of <br> Items for Alignment <br> to OKC $^{3} \boldsymbol{*}$ | Actual <br> Number of <br> Items on 2013 <br> Test Form A | Actual <br> Number of <br> Items on 2013 <br> Test Form B |
| :--- | :---: | :---: | :---: |
| Number Sense and Algebraic Operations | $\mathbf{1 5}$ |  |  |
| Equations and Formulas (1.1) | 6 | 6 | 6 |
| Expressions (1.2) | 9 | 9 | 9 |
| Relations and Functions | $\mathbf{3 1}$ |  |  |
| Relations and Functions (2.1) | 6 | 6 | 6 |
| Linear Equations and Graphs (2.2) | 15 | 15 | 15 |
| Linear Inequalities and Graphs (2.3) | 6 | 6 | 6 |
| Systems of Equations (2.4) | 4 | 4 | 4 |
| Data Analysis, Probability, and Statistics | $\mathbf{9}$ |  |  |
| Data Analysis (3.1) | 5 | 5 | 5 |
| Line of Best Fit (3.3) | 4 | 4 | 4 |
| Total Test | $\mathbf{5 5}$ | $\mathbf{5 5}$ | $\mathbf{5 5}$ |

*Suppressed item in this reporting category.

Table A2. OCCT Test Blueprint and Actual Item Counts: Algebra II

| OKC ${ }^{3}$ Standard and Objective | Ideal Number of Items for Alignment to $\boldsymbol{O K C}^{3}$ | Actual Number of Items on 2013 Test Form A | Actual Number of Items on 2013 <br> Test <br> Form B |
| :---: | :---: | :---: | :---: |
| Number Sense and Algebraic Operations | 15 |  |  |
| Rational Exponents (1.1) | 5-6 | 6 | 5 |
| Polynomial and Rational Expressions (1.2) | 5-6 | 5 | 6 |
| Complex Numbers (1.3) | 4 | 4 | 4 |
| Relations and Functions | 31 |  |  |
| Functions and Function Notation (2.1) | 5 | 5 | 5 |
| Systems of Equations (2.2) | 5 | 5 | 5 |
| Quadratic Equations and Functions (2.3) | 5 | 5 | 5 |
| Conic Sections (2.4) | 4 | 4 | 4 |
| Exponential and Logarithmic Functions (2.5) | 4 | 4 | 4 |
| Polynomial Equations and Functions (2.6) | 4 | 4 | 4 |
| Rational Equations and Functions (2.7) | 4 | 4 | 4 |
| Data Analysis, Probability, and Statistics | 9 |  |  |
| Analysis of Collected Data (3.1) | 5 | 5 | 5 |
| Arithmetic and Geometric Sequences (3.2) | 4 | 4 | 4 |
| Total Test | 55 | 55 | 55 |

Table A3. OCCT Test Blueprint and Actual Item Counts: Geometry

|  | Ideal <br> Number of <br> Items for <br> Alignment <br> to $\boldsymbol{O K C}^{3}$ | Actual <br> Number of <br> Items on <br> 2013 Test <br> Form A | Actual <br> Number of <br> Items on <br> 2013 Test <br> Form B |
| :--- | :---: | :---: | :---: |
| OKC $^{3}$ Standard and Objective | $\mathbf{6}$ |  |  |
| Logical Reasoning | 4 | 4 | 4 |
| Inductive and Deductive Reasoning (1.1) | 2 | 2 | 2 |
| Conditional Statements (1.2) | $\mathbf{2 0}$ |  |  |
| Properties of 2-Dimensional Figures | 4 | 4 | 4 |
| Line and Angle Relationships (2.1) | 4 | 4 | 4 |
| Polygons and Other Plane Figures (2.2) | 4 | 4 | 4 |
| Similarity (2.3) | 4 | 4 | 4 |
| Congruence (2.4) | 4 | 4 | 4 |
| Circles (2.5) | $\mathbf{1 2}$ |  |  |
| Triangles and Trigonometric Ratios | 4 | 4 | 4 |
| Pythagorean Theorem (3.1) | 4 | 4 | 4 |
| Right Triangle Relationships (3.2) | 4 | 4 | 4 |
| Trigonometric Functions (3.3) | $\mathbf{1 0}$ |  |  |
| Properties of 3-Dimensional Figures | 6 | 6 | 6 |
| Polyhedra and Other Solids (4.1) | 2 | 2 | 2 |
| Similarity (4.2) | 2 | 2 | 2 |
| Models and Perspectives (4.3) | $\mathbf{7}$ |  |  |
| Coordinate Geometry | 4 | 4 | 4 |
| Properties of Points, Segments, and Lines | 3 | 3 | 3 |
| (5.1) | $\mathbf{5 5}$ | $\mathbf{5 5}$ | $\mathbf{5 5}$ |
| Properties of Figures (5.2) |  |  |  |

Table A4. OCCT Test Blueprint and Actual Item Counts: English II

| OKC ${ }^{3}$ Standard and Objective | Ideal Number of Items for Alignment to OKC ${ }^{3}$ * | Actual Number of Items on 2013 Test Form A | Actual Number of Items on 2013 Test Form B |
| :---: | :---: | :---: | :---: |
| Reading/Literature |  |  |  |
| Vocabulary | 6-8 | 6 | 6 |
| Comprehension | 16-20 |  |  |
| Literal Understanding (2.1) | 4-5 | 4 | 4 |
| Inferences and Interpretation (2.2) | 4-5 | 5 | 4 |
| Summary and Generalization (2.3) | 4-5 | 4 | 5 |
| Analysis and Examination (2.4) | 4-5 | 5 | 4 |
| Literature | 17-20 |  |  |
| Literary Genres (3.1) | 4-5 | 4 | 4 |
| Literary Elements (3.2) | 5-6 | 6 | 6 |
| Figurative Language and Sound Devices (3.3) | 4-5 | 4 | 5 |
| Literary Works (3.4) | 4-5 | 4 | 4 |
| Research and Information | 6 | 6 | 5 |
| Writing/Grammar/Usage and Mechanics |  |  |  |
| Writing (1.0, 2.0) | 1 (6 points) |  |  |
| Writing Prompt | 1 | 1 | 1 |
| Grammar/Usage and Mechanics | 12 |  |  |
| Standard English Usage (3.1) | 4 | 4 | 4 |
| Mechanics and Spelling (3.2) | 4 | 4 | 4 |
| Sentence Structure (3.3) | 4 | 4 | 4* |
| Total Test | 61 (66 Points) | 61 | 60 |

*Suppressed Item

Table A6. OCCT Test Blueprint and Actual Item Counts: Biology I

| OKC ${ }^{3}$ Standard and Objective | Ideal <br> Number of Items for Alignment to OKC $^{3 *}$ * | Actual Number of Items on 2013 Test Form A | Actual <br> Number <br> of Items <br> on 2013 <br> Test Form <br> B |
| :---: | :---: | :---: | :---: |
| Process Standards |  |  |  |
| Observe and Measure | 6 |  |  |
| Qualitative/quantitative observations and changes (P1.1) | 4 | 4 | 4 |
| Use appropriate tools \& (P1.2) and | 0 | 0 | 0 |
| Use appropriate SI units (P1.3) | 2 | 2 | 2 |
| Classify | 7-8 |  |  |
| Use observable properties to classify (P2.1) | 4 | 4 | 3 |
| Identify properties of a classification system (P2.2) | 3-4 | 4 | 4 |
| Experimental Design | 16-19 |  |  |
| Evaluate the design of investigations (P3.1) | 4-5 | 5 | 7 |
| Hazards/practice safety (P3.2) \& Identify a testable hypothesis in a biology investigation (P3.4) | 5-6 | 4 | 2 |
| Use mathematics to show relationships (P3.3) | 4-6 | 5 | 5 |
| Identify potential hazards and practice safety procedures in all science activities (P3.5) | 3 | 3 | 3 |
| Interpret and Communicate | 20-24 |  |  |
| Select predictions based on observed patterns of evidence (P4.1) | 4-5 | 4 | 4 |
| Interpret line, bar, trend, and circle graphs (P4.3) | 4-5 | 4 | 4 |
| Accept or reject a hypothesis (P4.4) | 4-5 | 5 | 4 |
| Make logical conclusions based on experimental data (4.5) | 4-5 | 4 | 6 |
| Identify an appropriate graph or chart (4.8) | 4 | 4 | 4 |
| Translate quantitative information expressed in words into visual form (4.8a) | 0 | 0 | 0 |
| Translate information expressed visually or mathematically (4.8b) | 0 | 0 | 0 |
| Model | 8 |  |  |
| Interpret a model which explains a given set of observations (5.1) | 4 | 4 | 4 |
| Select predictions based on models, using mathematics when appropriate (5.2) | 4 | 4 | 4 |
| Total Test | 60 | 60 | 60 |

Table A6. OCCT Test Blueprint and Actual Item Counts: Biology I (continued)

| OKC ${ }^{3}$ Standard and Objective | Ideal <br> Number of Items for Alignment to OKC ${ }^{3}$ * | Actual Number of Items on 2013 Test Form A | Actual Number of Items on 2013 Test Form B |
| :---: | :---: | :---: | :---: |
| Content Standards |  |  |  |
| The Cell | 12-15 |  |  |
| Cells structures and functions (C1.1) | 4-6 | 4 | 4 |
| Differentiation of cells (C1.2) | 4-6 | 4 | 4 |
| Specialized cells (C1.3) | 4 | 4 | 4 |
| The Molecular Basis of Heredity | 12-15 |  |  |
| DNA structure and function in heredity (C2.1) | 6-8 | 6 | 5 |
| Sorting and recombination of genes (C2.2) | 6-7 | 6 | 7 |
| Experimental Design | 16-19 |  |  |
| Evaluate the design of investigations (P3.1) | 4-5 | 5 | 7 |
| Hazards/practice safety (P3.2) \& Identify a testable hypothesis in a biology investigation (P3.4) | 5-6 | 4 | 2 |
| Use mathematics to show relationships (P3.3) | 4-6 | 5 | 5 |
| Identify potential hazards and practice safety procedures in all science activities (P3.5) | 3 | 3 | 3 |
| Biological Diversity | 12-15 |  |  |
| Variation among organisms (C3.1) | 4-6 | 4 | 4 |
| Natural selection and biological adaptations (C3.2) | 4-6 | 4 | 5 |
| Behavior patterns can be used to ensure reproductive success (C3.3) | 4 | 4 | 4 |
| The Interdependence of Organisms | 8-10 |  |  |
| Organisms both cooperate and compete (C4.1) | 4-6 | 4 | 4 |
| Population dynamics (C4.2) | 4-6 | 4 | 4 |
| Matter/Energy/Organization in Living Systems | 12-15 |  |  |
| Complexity and organization used for survival (C5.1) | 4 | 5 | 4 |
| Matter and energy flow in living and nonliving systems (C5.2) | 4 | 4 | 4 |
| Earth cycles including abiotic and biotic factors (C5.3) | 4 | 4 | 4 |
| Total Test | 57 | 57 | 57 |

** Items from the Safety Objective (P3.5) are not dual aligned to a content standard

Table A7. OCCT Test Blueprint and Actual Item Counts: U.S. History

| OKC ${ }^{3}$ Standard and Objective | Ideal Number of Items for Alignment to OKC ${ }^{3 *}$ | Actual Number of Items on 2013 Test Form A | Actual Number of Items on 2013 Test Form B |
| :---: | :---: | :---: | :---: |
| Post-Reconstruction to the Progressive Era, 1878-1900 | 8 |  |  |
| Post Reconstruction Amendments (1.1) | 2-4 | 0 | 2 |
| Immigration, Westward Movement, and Native American Experiences (1.2) | 2-4 | 3 | 2 |
| Impact of Industrialization on Society, Economics, and Politics (1.3) | 2-4 | 5 | 3 |
| Expanding Role of the United States in International Affairs | 6 | 9 | 8 |
| Cycles of Economic Boom and Bust in the 1920s and 1930s | 8 |  |  |
| Economic, Political, \& Social <br> Transformation Between the World Wars (3.1) | 3-5 | 5 | 5 |
| Economic Destabilization and the Great Depression/New Deal (3.2,3.3) | 3-5 | 6 | 6 |
| Foreign and Domestic Policies during the Cold War, 1945-1975 | 18 |  |  |
| The Cold War - Foreign and Domestic (5.1, 5.2) | 4-5 | 5 | 8 |
| The Vietnam War Era (5.3) | 4-5 | 5 | 5 |
| The African American Civil Rights Movement (5.4) | 4-6 | 5 | 4 |
| Social Political Transformation (5.5) | 4-5 | 6 | 3* |
| Total Test | 60 | 60 | 59 |

# A Statistical Investigation of Oklahoma Computer Disruptions 

Table of Contents

Introduction ..... 5
Methodology ..... 5
Description of Four Cohorts ..... 5
Computer Disruption Data Overview ..... 7
Propensity Score Matching ..... 9
2013 Score Differences ..... 10
Cohort A Analyses ..... 10
Cohort B Analyses ..... 15
Cohort C Analyses ..... 19
Cohort D Analyses ..... 23
Summary ..... 26
References ..... 27
Appendix ..... 28
List of Tables
Table 1. Number of Students Interrupted by Day and Grade on Math Test ..... 6
Table 2. Number of Students Interrupted by Day and Grade on Reading Test ..... 7
Table 3. Interruption Data by Subject and Grade ..... 8
Table 4. Frequency of Interruption by Test ..... 8
Table 5. Descriptive and Inferential Statistics of 2013 Test Scores After Matching - Cohort A.. 10
Table 6. Combined Regression Equation Adding Disruption - Cohort A ..... 11
Table 7. Separate Regression Equations for Disrupted and Non-Disrupted Groups - Cohort A12
Table 8. Distribution of the Difference between Predicted and Observed Scores for Non-disrupted and Disrupted Groups - Cohort A.14
Table 9. Percent of Disrupted Students with Predicted and Observed Score Differences at the 5th, 10th, 90th and 95th Percentile of Non-disrupted Students - Cohort A ..... 15
Table 10. Cohort A and Cohort B Comparison ..... 15
Table 11. Descriptive and Inferential Statistics of 2013 Test Scores After Matching - Cohort ..... 16
Table 12. Combined Regression Equation Adding Disruption - Cohort B ..... 16
Table 13. Separate Regression Equations for Disrupted and Non-Disrupted Groups - Cohort B ..... 17
Table 14. Distribution of the Difference between Predicted and Observed Scores for Non- disrupted and Disrupted Groups - Cohort B ..... 18
Table 15. Percent of Disrupted Students with Predicted and Observed Score Differences at the 5th, 10th, 90th and 95th Percentile of Non-disrupted Students - Cohort B ..... 19
Table 16. Interrupted Cases on 2013 Algebra I Test by Grade. ..... 20
Table 17. Descriptive and Inferential Statistics of 2013 Test Scores After Matching - Cohort C20
Table 18. Combined Regression Equation Adding Disruption - Cohort C ..... 20
Table 19. Separate Regression Equations for Disrupted and Non-Disrupted Groups - Cohort C ..... 21
Table 20. Distribution of the Difference between Predicted and Observed Scores for Non- disrupted and Disrupted Groups - Cohort C ..... 22

# A Statistical Investigation of Oklahoma Computer Disruptions 

#### Abstract

On April 29th and April 30th, 2013, students in Oklahoma experienced technological delays or "interruptions" while completing their statewide Math and Reading assessments. The potential impact of those disruptions on test scores is the focus of this investigation. Multiple analytical approaches were conducted to determine the presence and magnitude of any effects. Additionally, analyses were conducted on multiple "cohorts" of students to examine if the effects of disruption on these two days were disparate from typical delays or interruptions during testing.

The testing vendor, CTB McGraw/Hill (CTB), conducted their own investigation of the impact of the test interruptions. The Oklahoma Department of Education (ODE) requested that an independent investigation of the interruption also be conducted. The Human Resources Research Organization (HumRRO) was selected to conduct the independent investigation ${ }^{1}$. Data were provided by CTB (for the 2013 cohort of students) and ODE (test data from the prior vendor). CTB also shared their investigation methodology and results. This investigation verified CTB's initial data (e.g. percent of students impacted) but used independently derived methodology to investigate the impact of the interruptions and draw conclusions. HumRRO primarily compared students' predicted scores to their actual interrupted scores to investigate the presence and magnitude of the interruption effect.

HumRRO's analyses detected a small effect of the interruption. This effect was not consistent across grades and/or subjects, however. Students in some grade/subjects appear to have been disadvantaged by the interruption, while others performed better than expected. Even when statistically significant differences in mean scores were found within a grade/subject, the difference was not consistent across the distribution of students taking the test. Therefore, HumRRO does not recommend a mathematical adjustment of test scores.

\section*{Methodology}

The primary goal of this investigation was to determine if the score a disrupted student received would have been different if the student had not been disrupted. That is, if two students who were very similar on all available variables that predicted 2013 test scores differed only in whether or not they were disrupted, any differences in those test scores could be more confidently stated to be an effect of disruption. Propensity score matching provides the ability to match students with similar distributions on a set of variables (Connelly, Sackett, \& Waters, 2013). Each student in the disrupted group for each grade and subject test was matched with a student from the non-disrupted group. This matching was done using all available variables except for pertinent 2013 scores (i.e., the dependent variable). Multiple grades and subject tests were investigated leading to formation of four "cohorts."

## Description of Four Cohorts

Students in grades 6 through 8 completing their Math and Reading tests and students in high school completing their end of instruction (EOI) exams were included in the investigation. The

[^16]OK testing window for the grades $3-8$ tests runs from April 10 to April 30. Cohort A was defined first as all students in grades 6 through 8 who were interrupted during their Math and Reading tests. Because the interruptions on $4 / 29$ and $4 / 30$ were of particular interest, Cohort B was further refined from Cohort A to only include students who were interrupted on those two days. Tables 1 and 2 provide the frequencies of interruption by day and grade for Math and Reading tests, respectively. Clearly, interruptions on $4 / 29$ and $4 / 30$ were atypical.

Table 1. Number of Students Interrupted by Day and Grade on Math Test

|  | Grade |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Day | 6 | 7 | 8 | Total |
| $4 / 10 / 2013$ | 139 | 23 | 12 | 174 |
| $4 / 11 / 2013$ | 192 | 96 | 40 | 328 |
| $4 / 12 / 2013$ | 122 | 55 | 26 | 203 |
| $4 / 15 / 2013$ | 97 | 92 | 14 | 203 |
| $4 / 16 / 2013$ | 95 | 75 | 45 | 215 |
| $4 / 17 / 2013$ | 275 | 158 | 43 | 476 |
| $4 / 18 / 2013$ | 108 | 69 | 61 | 238 |
| $4 / 19 / 2013$ | 45 | 38 | 41 | 124 |
| $4 / 22 / 2013$ | 48 | 23 | 31 | 102 |
| $4 / 23 / 2013$ | 59 | 27 | 154 | 240 |
| $4 / 24 / 2013$ | 66 | 46 | 167 | 279 |
| $4 / 25 / 2013$ | 35 | 24 | 43 | 102 |
| $4 / 26 / 2013$ | 14 | 12 | 12 | 38 |
| $4 / 29 / 2013$ | 263 | 244 | 427 | 934 |
| $4 / 30 / 2013$ | 490 | 344 | 676 | $\mathbf{1 5 1 0}$ |
| $5 / 1 / 2013$ | 10 | 5 | 15 | 30 |
| $5 / 2 / 2013$ | 9 | 12 | 8 | 29 |
| $5 / 3 / 2013$ | 1 | 4 | 1 | 6 |
| $5 / 6 / 2013$ | 0 | 0 | 3 | 3 |
| $5 / 7 / 2013$ | 0 | 1 | 0 | 1 |
| Total | $\mathbf{2 0 6 8}$ | $\mathbf{1 3 4 8}$ | $\mathbf{1 8 1 9}$ | 5235 |

| Table 2. Number of Students Interrupted by Day and Grade on Reading Test |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Day | 6 | 7 | Grade |  |  |
| $4 / 10 / 2013$ | 174 | 86 | 78 | Total |  |
| $4 / 11 / 2013$ | 161 | 160 | 265 | 338 |  |
| $4 / 12 / 2013$ | 276 | 146 | 191 | 586 |  |
| $4 / 15 / 2013$ | 142 | 338 | 115 | 513 |  |
| $4 / 16 / 2013$ | 286 | 216 | 124 | 595 |  |
| $4 / 17 / 2013$ | 177 | 77 | 122 | 376 |  |
| $4 / 18 / 2013$ | 84 | 127 | 93 | 304 |  |
| $4 / 19 / 2013$ | 27 | 30 | 62 | 119 |  |
| $4 / 22 / 2013$ | 45 | 52 | 71 | 168 |  |
| $4 / 23 / 2013$ | 109 | 95 | 169 | 373 |  |
| $4 / 24 / 2013$ | 116 | 68 | 106 | 290 |  |
| $4 / 25 / 2013$ | 95 | 19 | 92 | 206 |  |
| $4 / 26 / 2013$ | 9 | 20 | 82 | 111 |  |
| $4 / 29 / 2013$ | $\mathbf{2 2 0}$ | $\mathbf{1 7 3}$ | 384 | $\mathbf{7 7 7}$ |  |
| $4 / \mathbf{3 0} / 2013$ | $\mathbf{3 5 7}$ | $\mathbf{2 6 9}$ | $\mathbf{2 6 4}$ | 890 |  |
| $5 / 1 / 2013$ | 52 | 10 | 11 | 73 |  |
| $5 / 2 / 2013$ | 7 | 16 | 11 | 34 |  |
| $5 / 3 / 2013$ | 1 | 3 | 1 | 5 |  |
| $5 / 6 / 2013$ | 1 | 0 | 3 | 4 |  |
| $5 / 7 / 2013$ | 0 | 1906 | $\mathbf{2 2 5 5}$ | 6500 |  |
| Total | $\mathbf{2 3 3}$ |  |  |  |  |

Interruptions also occurred during the EOI exams completed primarily by high school students. Using the available data, two additional cohorts were constructed to explore the presence of disruption effects on EOI exams. These cohorts were chosen primarily based on what data were available. More specifically, the goal was to choose exams that had sufficient sample size to detect disruption effects, if any. Cohort C focused on students interrupted during their Algebra I test whereas Cohort D focused on students interrupted during their English II exam.

The report that follows will focus first on Cohorts $A$ and $B$ followed by Cohorts $C$ and $D$.

## Computer Disruption Data Overview

Interruption data provided to HumRRO included the test subject and grade level that each student was completing at the time of interruption for Cohorts A and B. Archival data regarding the student's prior year performance, demographic information, as well as current year performance on other exams was also provided. A total of 130,429 valid, unique IDs with complete Math test scores were recorded and 130,373 valid, unique IDs with complete Reading test scores were also recorded. After integrating the interruption data provided to HumRRO, it appears that 5,235 students were interrupted during their Math test across all days out of 130,429 students. For the Reading test, 6,500 students were interrupted across all days out of 130,373 students. These students formed Cohort A. An interruption rate was calculated to
examine the prevalence of interruption. The numbers of disrupted and non-disrupted students before matching, separated by grade level, are provided in Table 3.

Table 3. Interruption Data by Subject and Grade

|  | Math |  |  |  | Reading |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Grade | All Students | Disrupted | Interruption <br> Rate | All Students | Disrupted | Interruption <br> Rate |  |
| 6 | 43,976 | 2,068 | $4.6 \%$ | 43,957 | 2,339 | $5.3 \%$ |  |
| 7 | 43,728 | 1,348 | $3.0 \%$ | 43,716 | 1,906 | $4.3 \%$ |  |
| 8 | 42,725 | 1,819 | $4.2 \%$ | 42,700 | 2,255 | $5.2 \%$ |  |
| Total | $\mathbf{1 3 0 , 4 2 9}$ | $\mathbf{5 , 2 3 5}$ | $\mathbf{4 . 0 \%}$ | $\mathbf{1 3 0 , 3 7 3}$ | $\mathbf{6 , 5 0 0}$ | $\mathbf{5 . 0 \%}$ |  |

The numbers of students in Table 3 are fairly consistent with those provided by CTB, for both non-disrupted and disrupted students. For those students who were disrupted, some were interrupted or delayed during their testing session multiple times. Although most students who were disrupted only experienced one delay, some students experienced many delays. Table 2 provides the frequency of disruption for each student in the disrupted group by test.

Table 4. Frequency of Interruption by Test

| Interruption <br> Number | Math | Reading |
| :---: | :---: | :---: |
| 1 | 4,455 | 5,446 |
| 2 | 423 | 681 |
| 3 | 186 | 171 |
| 4 | 80 | 88 |
| 5 | 42 | 52 |
| 6 | 25 | 26 |
| 7 | 13 | 19 |
| 8 | 8 | 7 |
| 9 | 1 | 3 |
| 10 | 2 | 5 |
| 11 | 0 | 1 |
| 12 | 0 | 0 |
| 13 | 0 | 1 |

## Propensity Score Matching

In an attempt to isolate the potential effect of disruption, propensity score matching was employed to select a sample of students from the non-disrupted group that closely resembles the disrupted group on all variables available that relate to 2013 scores. In one sense, propensity score matching attempts to "control for" these variables. With these groups established, differences in 2013 scores are more likely to be due to an effect of disruption.

The following variables were used as matching variables for Cohorts A and B:

- 2012 Math and Reading scaled scores
- Other subject 2013 scale scores (Reading score used if interrupted on 2013 Math test)
- Gender ( $0=$ Female, $1=$ Male)
- Ethnicity (Dummy coded)
- Limited English proficiency
- Student-level free/reduced lunch
- School-level proportion of free/reduced lunch students
- School-level achievement (Average of 2012 student-level Reading and Math scores)

Differences between disrupted and non-disrupted students on these matching variables were examined prior to matching. These differences were calculated using Cohen's $d$ with "rule of thumb" cutoff values suggested by Harder, Stuart, \& Anthony (2010). Across grades and subjects, the disrupted students seemed to be disproportionately African American and from schools with more free and reduced lunch students and lower achievement means. Given the relationships between these variables and the test scores on the disrupted test, it is clear why propensity score matching is a necessary method.

Next, using logistic regression, we regressed group membership (disrupted or not disrupted) on to the matching variables. Generally, the pseudo R-square values of the logistic regression were small, ranging from .0042 to .0242 . Overall, the small values suggest that the combination of prior year student achievement, demographics, SES, school-level achievement or schoollevel SES had little relationship to the likelihood that a student experienced disruptions.

To match the two samples, the predicted disruption probabilities from the logistic regression analyses were saved. The predicted probabilities represent the probability that a student was in the disrupted sample. We used the nearest neighbor method to match the two samples. That is, the predicted disruption probability for each student in the disrupted sample was matched to the student with the closest predicted disruption probability in the non-disrupted sample. The sampling was done without replacement so that each student in the disrupted sample was matched with a unique student in the non-disrupted sample. The average difference between a disrupted student's predicted probability and the matched non-disrupted student's predicted probability was .000003 for Reading and .000003 for Math. The largest difference was .0016 . Differences no larger than . 20 have been shown to reduce bias and produce accurate group difference estimates (Austin, 2009; Connelly, Sackett, \& Waters, 2013). The results suggest that everyone in the disrupted sample was matched with a student in the non-disrupted sample with a very similar predicted disruption probability. To further evaluate the closeness of the matched sample, we examined the mean difference of the matching variables. The average Cohen's $d$ between the two samples was .002 and ranged from -.060 to .075 after matching. All of the differences greater than .10 prior to matching were reduced. Near zero effect sizes suggest that
our samples have been effectively balanced on prior year achievement, school-level achievement, gender, ethnicity, and school-level free-or-reduced percentage. A summary of the mean, standard deviations, and effect sizes before and after matching can be found in the Appendix.

## 2013 Score Differences

Using the matched samples, we examined whether students' scores for tests impacted by computer interruptions differed from students' scores that were not impacted by computer disruptions. By matching the samples on variables that are likely to predict student scores, any difference between the two samples can be better attributed to the computer disruptions. We used a number of analyses to examine differences in scores. Scale scores for Math and Reading for the matched groups were examined four ways:

1. Mean differences on 2013 scores
2. $R^{2}$ change when combing groups and adding dichotomous disruption variable
3. $R^{2}$ differences when predicting 2013 scores separately
4. Applying Non-Disrupted regression equation from step 3 onto Disrupted group as well as $5^{\text {th }}, 10^{\text {th }}, 90^{\text {th }}$, and $95^{\text {th }}$ percentile cuts

## Cohort A Analyses

## Differences in average 2013 test scores

Because these two matched groups are alike on variables that are typically predictive of test scores, if testing disruptions had no overall impact, then the averages of the 2013 test scores for the two groups would be expected to be nearly identical. Differences in the average 2013 test scores would be evidence that computer disruption impacted test performance. We examined mean differences between the two samples using a t-test and Cohen's $d$ effect size. Table 5 presents the results by grade and subject for Cohort A.

Table 5. Descriptive and Inferential Statistics of 2013 Test Scores After Matching - Cohort A

|  | Disrupted |  |  |  |  |  | Non-Disrupted |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: | :---: |
|  | $N$ | Mean | SD | Mean | SD | $t$ | $d$ |  |  |  |  |  |
| Grade 6 Reading | 2,002 | 733.7 | 77.87 | 731.9 | 73.84 | -0.75 | 0.024 |  |  |  |  |  |
| Grade 7 Reading | 1,625 | 724.6 | 66.99 | 726.4 | 68.69 | 0.76 | -0.027 |  |  |  |  |  |
| Grade 8 Reading | 1,900 | 757.8 | 84.37 | 758.6 | 78.62 | 0.32 | -0.010 |  |  |  |  |  |
| Grade 6 Math | 1,710 | 744.9 | 77.77 | 743.6 | 75.24 | -0.49 | 0.017 |  |  |  |  |  |
| Grade 7 Math | 1,085 | 726.5 | 84.46 | 730.8 | 80.98 | 1.22 | -0.052 |  |  |  |  |  |
| Grade 8 Math | 1,533 | 727.8 | 79.72 | 732.0 | 86.09 | 1.42 | -0.051 |  |  |  |  |  |

Note. No $p$-values below . 05.
For Reading, the effect sizes ranged from -.027 to .024 , suggesting no overall directional effect. For Math, the effect sizes ranged from -. 052 to .017 . All effect sizes indicate very small mean differences between scale scores of the matched samples.

## Examining the predictability of 2013 test scores

First, to examine predictability of 2013 test scores, we examined the incremental variance that disruption accounted for when added to the prediction of the 2013 test scores beyond other known indicators of performance (including prior year achievement, ethnicity, gender, schoollevel achievement, and school-level percentage of free-or-reduced lunch). If the inclusion of disruption in the multiple regression models adds to the estimation of 2013 scores, then this would supply evidence that disruption impacted 2013 test scores. For this model, the two groups were included in the regression models together.

Table 6 reports the R-square values for each model and the R-square change between the two models. With the inclusion of disruption in the model, the R-square value changed very little or not at all, indicating that disruption did not add to the prediction of 2013 scores.

Table 6. Combined Regression Equation Adding Disruption - Cohort A

|  | Covariates Only <br> $\mathrm{R}^{2}$ |  |  |  |
| :--- | :---: | :---: | :---: | ---: |
| Covariates + <br> Disrupted $\mathrm{R}^{2}$ | $\Delta \mathrm{R}^{2}$ |  |  |  |
| Grade 6 Reading | 4,004 | 0.5759 | 0.5760 | $<0.001$ |
| Grade 7 Reading | 3,250 | 0.5331 | 0.5339 | 0.001 |
| Grade 8 Reading | 3,800 | 0.5105 | 0.5105 | $<0.001$ |
| Grade 6 Math | 3,420 | 0.5788 | 0.5791 | $<0.001$ |
| Grade 7 Math | 2,170 | 0.5550 | 0.5552 | $<0.001$ |
| Grade 8 Math | 3,066 | 0.5162 | 0.5167 | 0.001 |

Next, using all of the data we have available to create equations that predict students' 2013 test scores, we can statistically determine whether disrupted students scored differently than expected. Prediction equations were estimated for the disrupted students and separately for the matched sample of non-disrupted students. In addition to prediction equations, this technique gives us multiple regression coefficients (R-square) that can be interpreted like a correlation coefficient to tell us how well 2013 test scores can actually be predicted from our available data. If students' performance was affected, the strength of the prediction for the disrupted students should be less than the non-disrupted students as shown by lower multiple regression coefficients. A lower coefficient means that students' performance in the disrupted group was not as predictable as students' performance in the non-disrupted group. This would supply another piece of evidence about the impact of the computer disruptions. Table 7 presents the multiple regression coefficients (R-square) for the disrupted and non-disrupted groups. Overall, 2013 test scores were well predicted for both samples, with $52 \%$ to $59 \%$ of the variance accounted for by the predictor variables for Reading, and $55 \%$ to $59 \%$ for Math. Generally, there were slightly higher R-square values for the non-disrupted group, although the difference in variance accounted for was practically small ranging from $0.9 \%$ to $6 \%$.

Table 7. Separate Regression Equations for Disrupted and Non-Disrupted Groups - Cohort A

|  | $N$ | Disrupted $\mathrm{R}^{2}$ | Non-Disrupted $\mathrm{R}^{2}$ | $\Delta \mathrm{R}^{2}$ |
| :--- | :---: | :---: | :---: | :---: |
| Grade 6 Reading | 2,002 | 0.574 | 0.589 | -0.015 |
| Grade 7 Reading | 1,625 | 0.521 | 0.551 | -0.030 |
| Grade 8 Reading | 1,900 | 0.533 | 0.494 | 0.039 |
| Grade 6 Math | 1,710 | 0.578 | 0.587 | -0.009 |
| Grade 7 Math | 1,085 | 0.548 | 0.577 | -0.029 |
| Grade 8 Math | 1,533 | 0.488 | 0.547 | -0.059 |

## Examining distributions of predicted student scores

The prediction equations for the non-disrupted students give us a statistical statement about what to expect normally for students testing under non-disrupted conditions. We know that the prediction is not perfect, but given the high R-square values we can use the prediction equation to calculate how disrupted students might have scored had they not been disrupted. For each disrupted student, we computed their predicted score using the regression equation computed for the non-disrupted students. Next, we took the difference between the observed score and predicted score, where positive values indicate higher observed scores than predicted and negative values indicate higher predicted scores than observed--imagine a distribution of observed minus predicted score differences. "Large numbers" of students with "notable differences" between obtained and predicted scores provides another piece of evidence about the impact of the computer disruptions. Table 8 presents the distribution of observed and predicted scores for the disrupted and non-disrupted sample for Reading and Math. The difference between the observed and predicted score is also reported.

Finally, we assessed "large number" and a "notable difference" between obtained and predicted scores for interrupted students by comparing the difference in observed and predicted scores for the non-disrupted group to the difference for the disrupted group. Since our non-disrupted group of students represents what would be expected under normal testing conditions, on average, the difference between the observed and predicted score can be considered a baseline. That is, the average difference for non-disrupted students is what is expected to naturally occur based on the fact that our prediction, inherently, can never be perfect.

We evaluated differences in two ways. First, we examined the difference in the standard deviation of differences for the disrupted and non-disrupted group using an $F$-test. This provides information on whether the spread of differences in predicted and observed scores is statistically different for the two groups (i.e., students are more affected, on average, in the disrupted group than the non-disrupted group). Results suggest that the standard deviation of the difference scores is larger in the disrupted group for grade 6 Reading and grades 6 and 7 Math (see bolded SDs in Table 8).

Next, we took the difference in observed and predicted scores at the $5^{\text {th }}, 10^{\text {th }}, 90^{\text {th }}$ and $95^{\text {th }}$ percentile for the non-disrupted group and determined the number of students in the disrupted group that were at or below the same cut point for the $5^{\text {th }}$ and $10^{\text {th }}$ percentile and those that were at or above the cut point for the $90^{\text {th }}$ and $95^{\text {th }}$ percentile. If there are a large number of students below the $5^{\text {th }}$ and $10^{\text {th }}$ percentile of the non-disrupted group than what would be expected ( $5 \%$ and $10 \%$, respectively) then more students in the disrupted group scored lower than expected. On the other hand, if there are a large number of students above the $90^{\text {th }}$ and
$95^{\text {th }}$ percentile of the non-disrupted group ( $10 \%$ and $5 \%$, respectively) then more students in the disrupted group scored higher than expected. Either case would provide evidence that the computer disruption had an impact on scores. Table 9 presents the percent of students in the disrupted group with score differences less than the $5^{\text {th }}$ and $10^{\text {th }}$ percentile and higher than the $90^{\text {th }}$ and $95^{\text {th }}$ percentile of the non-disrupted group.

Table 8. Distribution of the Difference between Predicted and Observed Scores for Non-disrupted and Disrupted Groups - Cohort A

|  | $N$ | Disrupted |  |  |  |  |  | $N$ | Non-Disrupted |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Mean | SD | 5th | 10th | 90th | 95th |  | Mean | SD | 5th | 10th | 90th | 95th |
| Grade 6 Reading |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Note. Bolded values indicate significantly larger standard deviation for Disrupted group at $p<.05$.

## Compare predictions for interrupted students to non-interrupted students

Table 9. Percent of Disrupted Students with Predicted and Observed Score Differences at the 5th, 10th, 90th and 95th Percentile of Non-disrupted Students - Cohort A

|  | $N$ | 5th | 10th | 90th | 95th |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Larger than $5 \%$ or $10 \%=$ Disadvantaged |  | Larger than $5 \%$ or $10 \%=$ Advantaged |  |
| Grade 6 Reading | 2,002 | 5.29\% | 11.24\% | 10.94\% | 5.89\% |
| Grade 7 Reading | 1,625 | 8.74\% | 13.48\% | 9.97\% | 3.75\% |
| Grade 8 Reading | 1,900 | 5.32\% | 11.00\% | 10.05\% | 4.63\% |
| Grade 6 Math | 1,710 | 4.85\% | 10.23\% | 9.82\% | 5.79\% |
| Grade 7 Math | 1,085 | 6.54\% | 11.43\% | 11.24\% | 5.81\% |
| Grade 8 Math | 1,533 | 5.54\% | 11.02\% | 8.61\% | 3.78\% |

For Reading, the results show a slightly higher percent of students above the $5^{\text {th }}$ and $10^{\text {th }}$ cut point for grade 7. These results suggest that for grade 7 Reading, approximately $3.74 \%$ of students had lower observed scores than predicted scores based on the non-disrupted sample. In Math, the differences around the $5^{\text {th }}$ and $10^{\text {th }}$ percentiles were less pronounced, although the actual percentages did bounce around what would be expected.

On the upper end of the distribution, it can be noted that some students in the disrupted group scored higher than what would be expected. For example, some students in the disrupted sample scored high in Grade 7 Math than what was expected, but there were other students in this same group that were disadvantaged.

## Cohort B Analyses

Because the disruptions on $4 / 29$ and $4 / 30$ appeared to be more pronounced, the above analyses were replicated using only students disrupted on $4 / 29$ and $4 / 30$ as the disrupted sample. In this way, any effect of disruption, on average, may be more pronounced on this sample than by looking at students disrupted on any day.

Table 10. Cohort A and Cohort B Comparison

|  | Math |  |  | Reading |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Grade | Cohort A | Cohort B | Proportion <br> of Cohort A | Cohort A | Cohort B | Proportion <br> of Cohort A |
| 6 | 2,068 | 753 | 0.36 | 2,339 | 577 | 0.25 |
| 7 | 1,348 | 588 | 0.44 | 1,906 | 442 | 0.23 |
| 8 | 1,819 | 1,103 | 0.61 | 2,255 | 648 | 0.29 |
| Total | $\mathbf{5 , 2 3 5}$ | $\mathbf{2 , 4 4 4}$ |  | $\mathbf{6 , 5 0 0}$ | $\mathbf{1 , 6 6 7}$ |  |

Interestingly, the proportions of students in Cohort A who are also in Cohort B vary by grade and subject. Grade 8 Math students appear to have primarily been interrupted on 4/29 or 4/30.

Propensity score matching was again used to match the reduced sample of disrupted students to similar students in the non-disrupted group. The same four analyses conducted on Cohort A were also conducted on Cohort B.

Table 11. Descriptive and Inferential Statistics of 2013 Test Scores After Matching - Cohort B

|  | Disrupted |  |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
|  | $N$ | Mean | SD | Mean-Disrupted | SD | $t$ | $d$ |
| Grade 6 Reading | 468 | 756.3 | 82.39 | 750.2 | 77.78 | -1.16 | 0.08 |
| Grade 7 Reading | 617 | 743.2 | 78.27 | 744.9 | 74.07 | 0.39 | -0.02 |
| Grade 8 Reading | 369 | 726.7 | 73.87 | 726.1 | 67.22 | -0.12 | 0.01 |
| Grade 6 Math | 455 | 728.5 | 89.21 | 726.8 | 72.02 | -0.33 | 0.02 |
| Grade 7 Math | 543 | 755.5 | 93.14 | 762.5 | 86.29 | 1.28 | -0.08 |
| Grade 8 Math | 932 | 719.5 | 81.63 | 729.0 | 86.01 | $2.44^{*}$ | -0.11 |

* $p<.05$.

Mean scores between the matched disrupted and non-disrupted students were neither statistically nor practically significant except for Grade 8 Math. Although the mean score of disrupted students was lower than the non-disrupted students at a statistical level, the practical significance was still small. Additionally, with 932 students in both samples, the power of this statistical test is very high so even a small difference may be statistically significant.

## Examining the predictability of 2013 test scores

Regression equations were formed using the same predictor variables as in Cohort A. Again, one regression combined the disrupted and non-disrupted groups to examine the increase in predictive validity when adding "disruption" to the equation. Overall, the changes in $R^{2}$ values were very small.

Table 12. Combined Regression Equation Adding Disruption - Cohort B

|  |  |  |  | $\begin{array}{c}\text { Covariates Only } \\ \mathrm{R}^{2}\end{array}$ |
| :--- | :---: | :---: | :---: | :---: | \(\left.\begin{array}{c}Covariates+ <br>

Disrupted \mathrm{R}^{2}\end{array}\right] \Delta \mathrm{R}^{2}\)

Like Cohort A, two more regression equations were built to predict 2013 scores from the same predictor variables in the previous model. These models were run on both groups separately to examine if the difference in $R^{2}$ was substantively smaller in the disrupted group than the nondisrupted group. This may signal unexplained variance possibly attributable to a disruption effect. The $R^{2}$ values were smaller only in the Grade 8 Math exam, although this change is small, accounting for about $1 \%$ of variance explained.

Table 13. Separate Regression Equations for Disrupted and Non-Disrupted Groups - Cohort B

|  | $N$ | Disrupted $R^{2}$ | Non-Disrupted $R^{2}$ | $\Delta R^{2}$ |
| :--- | :---: | :---: | :---: | ---: |
| Grade 6 Reading | 468 | 0.619 | 0.604 | 0.015 |
| Grade 7 Reading | 369 | 0.555 | 0.532 | 0.024 |
| Grade 8 Reading | 543 | 0.574 | 0.530 | 0.045 |
| Grade 6 Math | 617 | 0.534 | 0.534 | $<0.000$ |
| Grade 7 Math | 455 | 0.504 | 0.498 | 0.006 |
| Grade 8 Math | 932 | 0.461 | 0.560 | -0.099 |

## Examining distributions of predicted student scores

By looking at the distribution of difference scores (i.e., observed minus predicted scores), we can determine, as best as our models predict, the scores students who were disrupted would have received if they were not disrupted. Given that Cohort B is a refined sample of Cohort A, any "notable difference" or effect of disruption could be expected to be more extreme in this sample.

An F-test was conducted comparing the variance of observed, predicted, and difference scores, of both groups. The significantly larger standard deviations for the disrupted group are bolded in Table 14. Interestingly, the Grade 8 Math disrupted group did not have statistically significantly larger variance than its matched non-disrupted group.

Table 14. Distribution of the Difference between Predicted and Observed Scores for Non-disrupted and Disrupted Groups - Cohort B

|  | $N$ | Disrupted |  |  |  |  |  | $N$ | Non-Disrupted |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Mean | SD | 5th | 10th | 90th | 95th |  | Mean | SD | 5th | 10th | 90th | 95th |
| Grade 6 Reading |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Difference | 468 | 3.28 | 53.38 | -87.02 | -58.63 | 60.40 | 89.60 | 468 | 0.00 | 48.97 | -69.55 | -53.25 | 62.78 | 81.71 |
| Predicted Score | 468 | 753.03 | 53.73 | 659.27 | 684.55 | 820.58 | 838.81 | 468 | 750.23 | 60.43 | 653.23 | 678.31 | 829.04 | 849.02 |
| Observed Score | 468 | 756.31 | 82.39 | 619 | 659 | 862 | 894 | 468 | 750.23 | 77.78 | 633 | 652 | 833 | 860 |
| Grade 7 Reading |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Difference | 369 | -1.86 | 51.87 | -86.94 | -63.94 | 51.56 | 71.41 | 369 | -0.01 | 46.01 | -65.14 | -53.04 | 55.97 | 79.64 |
| Predicted Score | 369 | 728.55 | 47.56 | 649.69 | 668.17 | 785.31 | 799.94 | 369 | 726.09 | 49.01 | 646.52 | 665.73 | 781.42 | 797.76 |

| Difference | 455 | -0.94 | 65.38 | -110.29 | -66.03 | 71.21 | 81.95 | 455 | -0.04 | 51.00 | -79.98 | -59.48 | 53.93 | 78.50 |
| Predicted Score | 455 | 729.48 | 53.50 | 637.79 | 659.40 | 791.01 | 812.24 | 455 | 726.81 | 50.85 | 646.49 | 670.06 | 784.81 | 799.42 |
| Observed Score | 455 | 728.54 | 89.21 | 597 | 639 | 827 | 852 | 455 | 726.76 | 72.02 | 618 | 648 | 807 | 838 |
| Grade 8 Math |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Difference | 932 | -8.80 | 61.36 | -99.62 | -77.95 | 60.03 | 87.78 | 932 | 0.02 | 57.07 | -86.13 | -61.29 | 67.03 | 93.85 |
| Predicted Score | 932 | 728.32 | 55.36 | 638.45 | 667.91 | 790.78 | 811.54 | 932 | 728.98 | 64.35 | 622.63 | 652.67 | 802.95 | 825.13 |
| Observed Score | 932 | 719.52 | 81.63 | 588 | 623 | 816 | 846 | 932 | 729.00 | 86.01 | 589 | 623 | 830 | 866 |

Note. Bolded values indicate significantly larger standard deviation for Disrupted group at $p<.05$.

## Compare predictions for interrupted students to non-interrupted students

Table 15. Percent of Disrupted Students with Predicted and Observed Score Differences at the 5th, 10th, 90th and 95th Percentile of Non-disrupted Students - Cohort B

|  |  | 5th |  | 10th |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  |  | Larger than 5\% or 10\% <br> Disadvantaged |  | Larger than 5\% or 10\% <br> Advantaged |  |
| Grade 6 Reading | 468 | $8.55 \%$ | $11.97 \%$ | $9.40 \%$ | $6.62 \%$ |
| Grade 7 Reading | 369 | $9.76 \%$ | $13.55 \%$ | $8.13 \%$ | $4.07 \%$ |
| Grade 8 Reading | 543 | $6.81 \%$ | $12.52 \%$ | $8.84 \%$ | $4.05 \%$ |
| Grade 6 Math | 617 | $4.70 \%$ | $10.86 \%$ | $11.02 \%$ | $5.67 \%$ |
| Grade 7 Math | 455 | $7.47 \%$ | $11.43 \%$ | $16.04 \%$ | $6.15 \%$ |
| Grade 8 Math | 932 | $6.97 \%$ | $14.81 \%$ | $8.80 \%$ | $4.08 \%$ |

According to Table 15, some disrupted students scored lower than expected whereas others scored higher than expected. The largest group of disadvantaged students appears to be Grade 8 Math at the $10^{\text {th }}$ percentile mark; however, other groups have larger proportions of students at the $5^{\text {th }}$ percentile mark.

## Cohort C Analyses

In addition to the interruptions in Grades 6 through 8 exams, HumRRO was provided student scores and interruption data for EOI exams. These exams are primarily completed by high school students and are often taken predominantly in one grade level. This is relevant in selecting variables to predict the current year scores. Since prior performance is the best predictor of future performance, this fact limited our investigation to certain exams with available prior performance data.

Algebra I test scores were selected for Cohort C because most students who complete that exam are $9^{\text {th }}$ graders and their Grade 8 Math exam is available as a sufficient indicator of prior performance. However, some $7^{\text {th }}$ and $8^{\text {th }}$ graders also completed the Algebra 2013 test. These students also completed their Math exams in 2013 and 2012, which can be used as prior performance indicators. Given that these students are likely advanced in this subject (i.e., upper end of the ability distribution), we can examine these students separately to determine if disruption had a differential effect on higher ability students.

To be clear, Cohort C is comprised of students who completed the Algebra I test in 2013 matched with 2012 Math scores; therefore, this sample should consist primarily of students who were $9^{\text {th }}$ graders in spring 2013. The same 2013 Algebra I scores were matched to 2013 Math scores to result in a sample that primarily consists of students who were $7^{\text {th }}$ and $8^{\text {th }}$ graders in spring 2013. The same interruption data on the Algebra I test was used for both groups. The number of valid, unique Algebra I score records is 31,021; however, grade information was only provided in the interruption file. The number of interrupted cases during the 2013 Algebra I test by grade is displayed in Table 16.

Table 16. Interrupted Cases on 2013 Algebra I Test by Grade

|  | $N$ | Percentage |
| :--- | :---: | :---: |
| Grade 7 | 59 | $2.07 \%$ |
| Grade 8 | 602 | $21.08 \%$ |
| Grade 9 | 1,759 | $61.59 \%$ |
| Grade 10 | 347 | $12.15 \%$ |
| Grade 11 | 72 | $2.52 \%$ |
| Grade 12 | 17 | $0.60 \%$ |
| Total | $\mathbf{2 , 8 5 6}$ | $\mathbf{1 0 0 \%}$ |

Note that only the Grades 7 and 8 records from the interruption file were matched with the 2013 Algebra I score file to form the subset " 2013 Algebra $\left(7^{\text {th }} \& 8^{\text {th }}\right)$." All analyses were conducted on all groups after propensity score matching. The matching formulas were identical for Cohort C; however, Math 2013 scores were used for the grades 7 and 8 subset.

## Differences in average 2013 test scores

After propensity score matching, mean difference tests were performed on the matched samples. Note that the performance of the $7^{\text {th }}$ and $8^{\text {th }}$ grade group is higher than the group overall. Additionally, both Disrupted samples seem to have lower scores than the NonDisrupted matched samples, overall.

Table 17. Descriptive and Inferential Statistics of 2013 Test Scores After Matching - Cohort C

|  | $N$ | Disrupted |  | Non-Disrupted |  | $t$ | d |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Mean | SD | Mean | SD |  |  |
| 2013 Algebra | 2,179 | 739.5 | 50.17 | 744.7 | 49.41 | 3.40* | 0.10 |
| 2013 Algebra ( $7^{\text {th }} \& 8^{\text {th }}$ ) | 621 | 763.5 | 55.45 | 771.5 | 48.81 | 2.70* | 0.15 |

## Examining the predictability of 2013 test scores

The regression equations were performed on both groups in Cohort C. $R^{2}$ values were lower for the 2013 Algebra group likely due to only Math 2012 scores being available for a prior performance indicator. Including Math and Reading 2013 scores would have reduced the sample to the $7^{\text {th }}$ and $8^{\text {th }}$ grade group since $9^{\text {th }}$ graders likely did not complete the 2013 Math and Reading tests meant for $8^{\text {th }}$ graders. Importantly, the change in $R^{2}$ values were not practically large, indicating a near-zero effect of disruption on Algebra score variance.

Table 18. Combined Regression Equation Adding Disruption - Cohort C

|  | Covariates Only <br> $R^{2}$ |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| 2013 Algebra | Covariates + <br> Disrupted $R^{2}$ | $\Delta R^{2}$ |  |  |
| 2013 Algebra $\left(7^{\text {th }} \& 8^{\text {th }}\right)$ | 4,358 | 0.3445 | 0.3460 | -0.002 |

The separate regression equations indicated less variance explained in the Disrupted group than the Non-Disrupted group by about 2 or $3 \%$. Although this difference is likely practically small, it is in the direction of concern. Further analyses may signal a consistent disadvantage in one of the Cohort C groups.

Table 19. Separate Regression Equations for Disrupted and Non-Disrupted Groups - Cohort C

|  | $N$ | Disrupted $\mathrm{R}^{2}$ | Non-Disrupted $\mathrm{R}^{2}$ | $\Delta \mathrm{R}^{2}$ |
| :--- | :---: | :---: | :---: | :---: |
| 2013 Algebra | 2,179 | 0.332 | 0.360 | -0.029 |
| 2013 Algebra $\left(7^{\text {th }} \& 8^{\text {th }}\right)$ | 621 | 0.557 | 0.577 | -0.021 |

## Examining distributions of predicted student scores

The distributions of observed, predicted, and difference scores were examined for Cohort C focusing on the $7^{\text {th }}$ and $8^{\text {th }}$ grade students who were at the higher end of the ability distribution. The $F$-tests to compare the variances of the scores between the groups was again conducted. Those results may be found in Table 20.

The $7^{\text {th }}$ and $8^{\text {th }}$ grade group had a statistically significantly larger variance in difference scores for the Disrupted group than the Non-Disrupted group. This result foreshadows larger proportions of students below (and perhaps above) the percentile cuts.

Table 20. Distribution of the Difference between Predicted and Observed Scores for Non-disrupted and Disrupted Groups - Cohort C

Note. Bolded values indicate significantly larger standard deviation for Disrupted group at $p<.05$.

## Compare predictions for interrupted students to non-interrupted students

Table 21. Percent of Disrupted Students with Predicted and Observed Score Differences at the 5th, 10th, 90th and 95th Percentile of Non-disrupted Students - Cohort C

|  |  | 5th |  | 10th | 90th |  | 95th |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Larger than 5\% or 10\% |  | Larger than 5\% or 10\% $=$ |  |  |  |
|  |  | Disadvantaged |  | Advantaged |  |  |  |
| 2013 Algebra | 2,179 | 5.42 | 10.65 | 8.08 | 4.91 |  |  |
| 2013 Algebra $\left(7^{\text {th }} \& 8^{\text {th }}\right)$ | 621 | 9.34 | 17.07 | 9.66 | 6.60 |  |  |

Table 21 contains the percentages of students in the Disrupted group above or below the percentile cuts of the Non-Disrupted Students. The $7^{\text {th }}$ and $8^{\text {th }}$ grade students who were interrupted while completing the Algebra I test in 2013 were proportionately more disadvantaged than advantaged. In other words, it appears that $7^{\text {th }}$ and $8^{\text {th }}$ grade students were differentially affected by interruption, on average, than others completing the same exam.

## Cohort D Analyses

Another set of students completing an EOI test was examined. The English II test was chosen due to the available data in the EOI dataset. A measure of prior performance was desired for creating the matched sample. However, because students typically take the English II test in Grade 10, the nearest other assessment where most students also had scores was the US History EOI. Using the US History EOI was not a perfect solution, however. The content was obviously different, but highly correlated. The bigger issue was that not all English II EOI interrupted student also had a US History score.

After examining the students who were disrupted on the English II test who had US History test scores, another approach was developed to increase the sample size. More data was provided to HumRRO that enabled us to use 2011 reading test scores (from when the Grade 10 student were in Grade 8) as a prior performance indicator. This approach increased the sample size of non-disrupted students and provided an improved prediction model for the 2013 English II scores. Therefore, both groups are presented as Cohort D, much like Cohort C had two groups focused on the same exam.

For clarity, "2013 English Group 1" is all students who had US History exam scores as a "prior performance" indicator and "2013 English Group 2" is all students who had 2011 Reading scores as a predictor of performance. The prediction models differed primarily in these variables. Group 2 also included 2011 Math scores since the data was available for nearly every student.

## Differences in average 2013 test scores

After propensity score matching, mean difference tests were performed on the matched samples. Disrupted students in Group 1 did better than matched Non-Disrupted students; however, this difference was neither statistically nor practically different. Group 2 mean difference was in the opposite direction, but this was also non-significant and small.

Table 22. Descriptive and Inferential Statistics of 2013 Test Scores After Matching - Cohort D

|  |  | Disrupted |  |  | Non-Disrupted |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mean | SD | Mean | SD | $t$ | $d$ |  |  |
| 2013 English Group 1 | 427 | 748.4 | 74.80 | 746.1 | 73.47 | -0.44 | -0.03 |  |
| 2013 English Group 2 | 2,688 | 763.6 | 64.10 | 765.2 | 67.92 | 0.93 | 0.03 |  |

Note. No $p$-values below . 05 .

## Examining the predictability of 2013 test scores

The regression equations were performed on both groups in Cohort D. $R^{2}$ values were lower for the Group 2 equations because the 2011 scores were not a recent test score, limiting the predictive power. However, for both groups, the "Disrupted" dichotomous variable does not additionally explain a practically large amount of English II test score variance.

Table 23. Combined Regression Equation Adding Disruption - Cohort D

|  | Covariates Only <br> 2013 English Group 1 |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | 854 | $\mathrm{R}^{2}$ | Covariates + <br> Disrupted $\mathrm{R}^{2}$ | $\Delta \mathrm{R}^{2}$ |
| 2013 English Group 2 | 5,376 | 0.3187 | 0.5188 | $<0.001$ |

The separate regression equations indicated more variance explained in the Disrupted group than the Non-Disrupted group in the Group 1 analyses, with a difference of about 4\%. This is not a large difference and is of less concern that if Disrupted students had less variance explained. The difference in Group 2 equations is practically very small.

Table 24. Separate Regression Equations for Disrupted and Non-Disrupted Groups - Cohort D

|  | $N$ | Disrupted $R^{2}$ | Non-Disrupted $R^{2}$ | $\Delta R^{2}$ |
| :--- | :---: | :---: | :---: | :---: |
| 2013 English Group 1 | 427 | 0.545 | 0.503 | 0.042 |
| 2013 English Group 2 | 2,688 | 0.351 | 0.354 | -0.003 |

## Examining distributions of predicted student scores

The distributions of observed, predicted, and difference scores were examined for Cohort D and the $F$-tests to compare the variances of the scores between the groups were again conducted. Those results may be found in Table 25. Only one variable had larger variance for the Disrupted group at a significant level.

Table 25. Distribution of the Difference between Predicted and Observed Scores for Non-disrupted and Disrupted Groups - Cohort D

|  | $N$ | Disrupted |  |  |  |  |  | $N$ | Non-Disrupted |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Mean | SD | 5th | 10th | 90th | 95th |  | Mean | SD | 5th | 10th | 90th | 95th |
| English Group 1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Difference | 427 | 1.26 | 51.41 | -77.54 | -54.29 | 57.77 | 74.86 | 427 | -0.04 | 51.82 | -87.26 | -59.88 | 60.36 | 79.94 |
| Predicted Score | 427 | 747.09 | 52.14 | 653.61 | 683.34 | 814.11 | 834.58 | 427 | 746.15 | 52.09 | 655.99 | 680.26 | 817.72 | 834.51 |
| Observed Score | 427 | 748.36 | 74.80 | 615 | 656 | 838 | 859 | 427 | 746.11 | 73.47 | 622 | 656 | 838 | 864 |
| English Group 2 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Difference | 2688 | -1.78 | 52.00 | -80.89 | -61.72 | 60.27 | 80.57 | 2688 | -0.05 | 55.00 | -82.57 | -60.67 | 59.01 | 80.11 |
| Predicted Score | 2688 | 765.34 | 43.00 | 704.70 | 725.90 | 808.70 | 822.30 | 2688 | 765.29 | 40.00 | 709.20 | 724.60 | 807.50 | 821.90 |
| Observed Score | 2688 | 763.56 | 64.00 | 662 | 693 | 838 | 864 | 2688 | 765.24 | 68.00 | 654 | 687 | 840 | 859 |

Note. Bolded values indicate significantly larger standard deviation for Disrupted group at $p<.05$.

Compare predictions for interrupted students to non-interrupted students
Table 26. Percent of Disrupted Students with Predicted and Observed Score Differences at the 5th, 10th, 90th and 95th Percentile of Non-disrupted Students - Cohort D

|  | $N$ | 5th | 10th | 90th | 95th |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Larger than $5 \%$ or $10 \%=$ Disadvantaged |  | Larger than $5 \%$ or $10 \%=$ Advantaged |  |
| 2013 English Group 1 | 427 | 3.75 | 8.20 | 9.84 | 3.75 |
| 2013 English Group 2 | 2,688 | 4.84 | 10.27 | 10.42 | 5.21 |

The percentages of students in the Disrupted group beyond the cutoff of the Non-Disrupted group are provided in Table 26. It seems that fewer students were both advantaged and disadvantaged in Group 1, but these differences do not appear large. The percentages for Group 2 are very close to the expected values and there appear to be no strong directional concerns.

## Summary

This report provides a statistical investigation of computer disruptions on student test scores. A number of analyses were conducted on many groups of students completing different tests to investigate whether computer disruptions impacted scores. The only group that seemed to be disadvantaged was the $7^{\text {th }}$ and $8^{\text {th }}$ graders completing the Algebra I test, and the disadvantage was not consistent throughout the distribution of student scores. These differences rely on the predictability of the model, which is inherently imperfect. While there is some evidence to suggest that there were effects from the disruption, nothing emerged in a systematic way across grades, subjects, or methodologies that merit a statistical adjustment. While we cannot know for an individual student that the computer disruption did not impact his or her test score, we conclude that for the overall population of Oklahoma students the computer disruptions had little impact on student test scores.

Note. Bolded values indicate Cohen's $d$ greater than .10 or -. 10 .

[^0]:    ${ }^{1}$ The probability of a correct classification by chance (Chance) is the probability that the classification is correct and is due to chance alone. The probability of Chance is estimated under a complete random assignment procedure using the marginal distribution of each form. The Chance probabilities are expected to be low.
