## Oklahoma School Testing Program

## Oklahoma Core Curriculum Tests

## Grades 3 to 8 Assessments

## 2011 Technical Report

Submitted to
The Oklahoma State Department of Education
October 2011

## Executive Summary

## Introduction

The Oklahoma Core Curriculum Tests (OCCT) is one component of the Oklahoma School Testing Program (OSTP). The OCCT is a state-wide criterion referenced assessment program that includes currently include tests of Mathematic and Reading in grades 3 through 8; Science in grades 5 and 8; Social Studies in grades 5, 7(Geography), and 8 (U.S. History, Constitution, and Government); and Writing in grades 5 and 8 . Each test is designed as a measure of a student's knowledge relative to the Priority Academic Student Skills (PASS), Oklahoma's content standards.

The OCCT tests of Writing were administered on March 9, 2011. Three tests-grade 7 Geography, grade 8 Mathematics, and grade 8 Reading are primarily computer delivery (a paper form is available), and were administered during the online test window from April 11, 2011 to May 6,2011. The remaining tests were administered as paper test between April 11, 2011and May 11, 2011. This report provides technical details of work accomplished through the end of 2011 on all of these tests.

## Purpose

The purpose of this Technical Report is to provide objective information regarding technical aspects of the OSTP-OCCT 3-8 assessments. This volume is intended to be one source of information to Oklahoma K-12 educational stakeholders (including testing coordinators, educators, parents, and other interested citizens) about the development, implementation, scoring, and technical attributes of the OCCT 3-8 assessments. Other sources of information regarding this battery of tests include the administration manuals, interpretation manuals, student-, teacher-, and parent guides, implementation materials, and training materials.

The information provided here fulfills legal, professional, and scientific guidelines (AERA, APA, \& NCME, 1999) for technical reports of large-scale educational assessments and is intended for use by qualified users within schools who use the OSTP-OCCT 3-8 assessments and interpret the results. Specifically, information was selected for inclusion in this report based on NCLB requirements and the following Standards for Educational and Psychological Testing:

- Standards 6.1-6.15 Supporting Documentation for Tests
- Standards 10.1-10.12 Testing Individuals with Disabilities
- Standards13.1-13.19 Educational Testing and Assessment

This technical report provides accurate, complete, current, and clear documentation of the OSTP-OCCT 3-8 development methods, data analysis, and results as is appropriate for use by qualified users and technical experts. Section 1 provides an overview of the test design, test content, and content standards. Section 2 provides summary information about the test administration. Section 3 details the classical item analyses and reliability results, and Section 4 details the calibration, equating, scaling analyses, and results. Section 5 provides the results of the classification accuracy and classifications studies. Finally, Section 6 provides higher-level summaries of all the tests included in the OSTP-OCCT 3-8 testing program.

Information provided in this report presents valuable information about the OSTP-OCCT 3-8 assessments regarding:

1. Content standards,
2. Content of the tests,
3. Test form design,
4. Administration of the tests,
5. Identification of ineffective items,
6. Detection of item bias,
7. Reliability of the tests,
8. Calibration of the tests,
9. Equating of tests,
10. Scaling and scoring of the tests, and
11. Decision accuracy and classification.

Each of these facets in the OSTP-OCCT 3-8 assessments development and use cycle is critical to validity of test scores and interpretation of results. This technical report covers all of these topics for the 2010-11 testing year.

## Section 1

## Overview of the Oklahoma School Testing Program (OSTP) Oklahoma Core Curriculum Tests (OCCT )of Grades 3 to 8

The Achieving Classroom Excellence End-of-Instruction assessment is a state-mandated, criterion-referenced testing program used to assess student proficiency. In the spring of 2011, the OCCT assessments were administered to all eligible public school students in Grades 3 through 8. Currently, this assessment program includes tests of Mathematics and Reading and the end of grades 3 through 8, tests of science and writing following grades 5 and 8 , and social studies tests at the end of grades 5,7 and 8 . The 2011 administration of the OCCT was the $17^{\text {th }}$ for students in Grades 5 and 8 and the $7^{\text {th }}$ for students in Grades 3, 4, and grade 7 social studies (Geography). This was the $6^{\text {th }}$ operational administration of the Reading and Mathematics tests in Grades 6 and 7.

All 19 assessments are designed to measure student performance relative to a specific set of academic skills established by committees of Oklahoma educators. This set of skills-the Priority Academic Student Skills (PASS)-represents skills that students are expected to master by the end of each grade for each subject. The OCCT are untimed tests, and with the exception of the writing assessment which is a single open-ended written response to a prompt, student performance is measured exclusively by multiple choice (MC) items. The MC Tests in grades 3 through five are administered in two sessions. All tests in grades 6 through $8^{\text {th }}$ grade and the grade 5 writing test are administered in a single session. The grade 8 Mathematics and Reading tests as well as the grade 7 geography tests were primarily computer delivered (paper forms were available only for make-ups for test test-takers with accommodations requiring a paper form). All other tests were administered exclusively as paper and pencil tests.

Pearson content specialists and research scientists worked with the Oklahoma State Department of Education (SDE) to construct OCCT test forms aligned to the PASS standards. In each test, a form consisted of a set of operational items used to produce student test scores and a set of embedded field-test items. The two Writing assessments consisted of a single constructed-response (CR) item. The Reading, Mathematics, Science, and Social Studies assessments were composed of Multiple-Choice (MC) items only. For each content and grade, there were eight forms ${ }^{1}$ consisting of a common set of operational items and a unique set of 10 field-test items. Responses to the operational items were used to produce student scores. Responses to the field-test items were used to evaluate the psychometric properties of these newly developed items for possible inclusion on future forms. In addition, to the regular operational form, an equivalent form was designated for all Mathematics and Reading tests as well as grade 7 Geography and a Braille version of each 2011 operational forms was created. A student could receive an equivalent form for various reasons, including becoming ill during test administration or experiencing some kind of security breach. The State Department of Education Office of

[^0]Accountability and Assessments determines eligibility for an equivalent form on a case-bycase basis. These students' responses were scored and reported using the scoring tables from the form's previous administration

### 1.1 Skills Assessed by the OCCT

The OCCT is developed with the expressed purpose of measuring the Oklahoma PASS content standards. In some cases, the PASS standards contain objectives that are not easily assessed in a large-scale and standardized format (e.g., English-Language Arts PASS standards include listening, reviewing). Standards that are not assessed using the OCCT must be assessed by school districts locally. A complete listing of all standards and objectives for all subjects and grades (measured and unmeasured) can be found on the SDE website (http://sde.state.ok.us/Curriculum/PASS/default.html.

A list of the testable standards for each subject are listed in Tables 1.1. For Math ${ }^{2}$ and Reading ${ }^{3}$, the same testable standards appear in each grade level.

The Tables in Appendix A provide information drawn from the 2011 test PASS blueprints. These tables show the PASS standards and objectives, as well as the number of items required for standard and objective according to the blueprint and actual number of items number of items appearing on the 2011 operational form.

Table 1.1. Testable Standards for OCCT Grades 3 to 8
Mathematics Grades 3 to 8

| Standard 1. | Algebraic Reasoning: Patterns and Relationships |
| :--- | :--- |
| Standard 2. | Number Sense and Operation |
| Standard 3. | Geometry |
| Standard 4. | Measurement |
| Standard 5. | Data Analysis |

## Reading Grades 4 to 8 (Grade 3)

Standard 1. (Standard 2.) Vocabulary
Standard 3. (Standard 4.) Comprehension/Critical Literacy
Standard 4. (Standard 5.) Literature
Standard 5. (Standard 6.) Research and Information

[^1]

### 1.2 Summary of Test Development and Content Validity

To ensure content validity of the OCCT tests, Pearson content experts closely study the Oklahoma Priority Academic Student Skills (PASS) and work with Oklahoma content area specialists, teachers, and assessment experts to develop a pool of items that measure Oklahoma's Assessment Frameworks (i.e., PASS) for each subject. Once the need for field test items was determined, based on the availability of items for future test construction, a pool of items that measured Oklahoma's PASS in each subject was developed. These items were developed under universal design guidelines set by the SDE and carefully reviewed and discussed by Content and Bias/Sensitivity Review Committees to evaluate not only content validity, but also plain language and the quality and appropriateness of the items. These committees were comprised of Oklahoma teachers and SDE staff. The committees’ recommendations were used to select and/or revise items from the item pool used to construct the field test portions of the Spring 2011 assessments.

## 1.2.a Aligning Test to PASS Content Standards

In addition to the test Blueprints provided by SDE (see Appendix A), Table 1.2 describes four criteria for test alignment with the PASS Standards and Objectives.

Table 1.2. Criteria for Aligning the Test with PASS Standards and Objectives.

|  | The test is constructed so that there are at least six <br> items measuring each PASS standard. The number of <br> items is based on estimating the number of items that <br> could produce a reasonably reliable estimate of a <br> student's mastery of the content measured. |
| :--- | :--- |
| 2. Depth-of Knowledge | The test is constructed using items from a variety of <br> Depth of Knowledge levels that are consistent with the <br> processes students need in order to demonstrate <br> proficiency for each <br> PASS objective. |
| 3. Range of Knowledge | The test is constructed so that at least 75\% of the <br> objectives for a PASS standard have at least <br> one corresponding assessment item. |
| Correspondence | The test is constructed according to the Test Blueprint <br> which reflects the degree of representation given on the <br> test to each PASS standard and/or objective in terms of <br> the percent of total test items measuring each standard <br> and the number of test items measuring each standard <br> and/or objective. The test construction shall yield a <br> balance of representation with an index of 0.7 or higher <br> of assessed objectives related to a standard. |
| 5. Balance-of-Representation |  |

## 1.2.b Additional Considerations in Item Selection

The source of the operational items eligible for inclusion on the Spring 2011 form is a pool of previously field-tested or operationally-administered items ranging from the Spring 2005 through the Spring 2010 administrations. In each case, items were calibrated using live data from the operational administrations to estimate parameters for these items.

To equate the forms across years, a set of operational items served as anchors or links to the base scale. Equating is necessary to account for slight year-to-year differences in form difficulty and to maintain comparability across years. Details of the equating procedures applied are provided in a subsequent section in this document. Content experts also targeted the percentage of items measuring various Depth of Knowledge (DOK) levels for assembling the tests. Table 1.3 provides the DOK level percentages for the Spring 2011 operational assessments.

Table 1.3. Percentage of Items by Depth of Knowledge Levels

| Subject | Grade | DOK Level |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 1 |  | 2 |  | 3 |  |
|  |  | Target | Actual | Target | Actual | Target | Actual |
| Math | 3 | 20-25 | 20 | 65-70 | 66 | 5-15 | 14 |
|  | 4 | 20-25 | 22 | 65-70 | 64 | 5-15 | 14 |
|  | 5 | 20-25 | 20 | 65-70 | 66 | 5-15 | 14 |
|  | 6 | 10-15 | 10 | 65-70 | 72 | 15-25 | 18 |
|  | 7 | 10-15 | 14 | 65-70 | 72 | 15-25 | 14 |
|  | 8 | 10-15 | 18 | 65-70 | 66 | 15-25 | 16 |
| Reading | 3 | 20-25 | 14 | 65-70 | 68 | 5-15 | 18 |
|  | 4 | 20-25 | 16 | 65-70 | 62 | 5-15 | 22 |
|  | 5 | 20-25 | 10 | 65-70 | 74 | 5-15 | 16 |
|  | 6 | 10-15 | 14 | 65-70 | 66 | 15-25 | 20 |
|  | 7 | 10-15 | 10 | 65-70 | 70 | 15-25 | 20 |
|  | 8 | 10-15 | 10 | 65-70 | 72 | 15-25 | 18 |
| Science | 5 | 20-25 | 20 | 65-70 | 62 | 5-15 | 18 |
|  | 8 | 10-15 | 18 | 65-70 | 69 | 15-25 | 13 |
| Social Studies | 5 | 20-25 | 23 | 65-70 | 62 | 5-15 | 15 |
|  | 7 | 10-15 | 18 | 65-70 | 67 | 15-25 | 16 |
|  | 8 | 10-15 | 16 | 65-70 | 69 | 15-25 | 16 |

Note: All values are in percentages.

## 1.2.c Configuration of Test Forms and Field-Test Design

Error! Reference source not found. provides an overview of the number of operational and field test items for the Spring 2011 OSTP-OCCT 3-8 assessments. The Spring 2011 test is comprised of single core of operational items on each form. For each of the MC based tests, at least $20 \%$ of the operational items were designated as potential anchor items to be used in the equating process (the process for acceptance as an anchor items is detailed in section 4). For the 17 MC tests, eight to eleven field-test forms were created. Each field-test form included the operation core and 10 field-test items. These items are embedded in the operational test forms with the intent of building the item bank for future use. Each form of the assessment was spiraled within classrooms to obtain randomly-equivalent samples of examinees for the field test items.

New items are field-tested to build up the item bank for future high stakes administrations. The overall field test design used by Pearson was an embedded field test design where newlydeveloped field test items were embedded throughout the test. The advantage of an embedded field test design is that test-takers do not know where the field test items are
located and therefore will treat each item as a scored item. Ten multiple choice field test items were placed in common positions on each forms of each assessment. Field test items were prioritized for inclusion on forms based on current item bank analyses which revealed which particular standards and objectives would benefit most from field testing. The tables in Appendix A contain the counts of field-test items aligned with each PASS objective.

Table 1.4. Configuration of the OSTP-OCCT 3-8 Tests for Spring 2011

| Subject | Grade | Total Number of |  |  |  |  | Maximum possible test items per FT form |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Core Forms | $\begin{gathered} \text { FT } \\ \text { Forms } \end{gathered}$ | $\begin{gathered} \mathrm{OP} \\ \text { items } \end{gathered}$ | $\begin{gathered} \text { FT } \\ \text { items } \end{gathered}$ | Total items | OP | FT | Total |
| Math | 3 | 1 | 8 | 50 | 80 | 130 | 50 | 10 | 60 |
|  | 4 | 1 | 8 | 50 | 80 | 130 | 50 | 10 | 60 |
|  | 5 | 1 | 8 | 50 | 80 | 130 | 50 | 10 | 60 |
|  | 6 | 1 | 11 | 50 | 80* | 130 | 50 | 10 | 60 |
|  | 7 | 1 | 8 | 50 | 80 | 130 | 50 | 10 | 60 |
|  | 8 | 1 | 8 | 50 | $96 \wedge$ | 146 | 50 | 12^ | 60 |
| Reading | 3 | 1 | 8 | 50 | 80 | 130 | 50 | 10 | 60 |
|  | 4 | 1 | 8 | 50 | 80 | 130 | 50 | 10 | 60 |
|  | 5 | 1 | 8 | 50 | 80 | 130 | 50 | 10 | 60 |
|  | 6 | 1 | 8 | 50 | 80 | 130 | 50 | 10 | 60 |
|  | 7 | 1 | 8 | 50 | 80 | 130 | 50 | 10 | 60 |
|  | 8 | 1 | 8 | 50 | 80 | 130 | 50 | 10 | 60 |
| Science | 5 | 1 | 8 | 45 | 80 | 125 | 45 | 10 | 55 |
|  | 8 | 1 | 8 | 45 | 80 | 125 | 45 | 10 | 55 |
| Social Studies | 5 |  | 8 |  | 80 | 140 | 60 | 10 | 70 |
|  | 7 | 1 | 8 | 45 | 80 | 125 | 45 | 10 | 55 |
|  | 8 | 1 | 8 | 45 | 80 | 125 | 45 | 10 | 55 |

Note: OP = Operational; FT = Field Test; *three of these field test items were administered across all forms and became part of the scored set post-administration (replacing three operational items); ^two technologically-enhanced items were administered per form for a total of 16 items.

## Section 2

## Administration of the OCCT in Grades 3 to 8

Valid and reliable assessment requires that assessments are first constructed in alignment with the Oklahoma content standards and then administered and scored according to sound measurement principles. Sound assessment practices require that schools administer all assessments in a consistent manner across the state so that all students have a fair and equitable opportunity for a score that accurately reflects their achievement in each subject. The schools play a key role in administering the OSTP-OCCT 3-8 assessments in a manner consistent with established procedures, monitoring the fair administration of the assessment, and working with the SDE office to address deviations from established assessment administration procedures. The role that district and school faculty members play is essential in the fair and equitable administration of the OCCT.

### 2.1 Packaging and Shipping

To provide OSTP-OCCT 3-8 with secure and dependable services for the shipping of the Oklahoma assessment materials, Pearson's Warehousing and Transportation Department maintains the quality and security of material distribution and return by using such methods as sealed trailers and hiring reputable carriers with the ability to immediately trace shipments. Pearson uses all available tracking capabilities to provide status information and early opportunities for corrective action.

Materials are packaged by school and delivered to the district coordinators. Each shipment to a district contains a shipping document set that includes a packing list for each school's materials and a pallet map that shows the identity and pallet assignment of each carton.

Materials are packaged using information provided by the Assessment Coordinators through Pearson's Access ${ }^{T M}$ website, and optionally with data received directly from Oklahoma. Oklahoma educators also use the Access ${ }^{T M}$ site to provide Pearson with the Pre-Identification information needed to print the student identification section on answer documents. Barcoding of all secure materials during the pre-packaging effort allows for accurate tracking of these materials through the entire packing, delivery, and return process. It also permits Pearson to inventory all materials throughout the packaging and delivery process along with the ability to provide the customer with status updates at any time. Use of handheld radiofrequency scanners in the packaging process help to eliminate the possibility of packing the wrong materials. The proprietary "pick-and-pack" process prompts packaging personnel as to what materials are to go in which shipping box. If the packer tries to pack the wrong item (or number of items into a shipping carton), the system signals an alert.

### 2.2 Materials Return

Test administration handbooks provide clear instructions on how to assemble, box, label, and return testing materials after test administration. Because of the criticality of used test materials and quantities often involved, safety is also a major concern, not only for the materials but for the people moving them. Only single-column boxes are used to distribute and collect test materials, so the weight of each carton is kept to a reasonable and manageable limit.

Paper bands are provided to group and secure used student response booklets for scoring. Color-coded return mailing labels with detailed return information (district address and code number, receipt address, box $x$ of $y$, shipper's tracking number, etc.) are also provided. These labels facilitate accurate and efficient sorting of each carton and its contents upon receipt at Pearson.

### 2.3 Materials Discrepancies Process

The image scanning process enables Pearson to concurrently capture Optical Mark Read (OMR) responses, images, and security information electronically. All scorable material discrepancies are captured, investigated by our Oklahoma Call Center team, reported, and resolved prior to a batch passing through a clean post edit and images being released for scoring.

As scanning of materials progresses, any discrepancies in materials received versus shipped are reported immediately to the SDE and scoring will begin. This system allows Pearson to proceed in scoring clean batches while any discrepant material issues are being resolved. As discrepant materials are received, they will be processed. Data from discrepant material receipts are captured in the same database as all other material receipts resulting in a complete record of materials for each school. As batches clear the clean post edit, clipped images are prepared and distributed for scoring. The Oklahoma Call Center Team notifies the SDE regarding unresolved material discrepancies within 24 hours after Pearson's initial attempt to contact the school principal. Within one week after materials are returned, Pearson's Service Center Team also notifies the SDE of any missing or incomplete shipments from schools that received testing materials.

Resolution of missing secure test materials and used answer booklets. Pearson provides updates on a daily basis to the initial discrepancy reports, in response to SDE specifications and requests. The Oklahoma Call Center team makes every attempt to resolve all discrepancies involving secure test books and used answer booklets in a timely manner. Using daily, updated discrepancy reports, Pearson is in constant contact with the respective districts/schools. Pearson and the SDE work out details on specific approaches to resolution of material return discrepancies, and what steps will be taken if "lost" secure test books and/or used answer documents are not found and remain unreturned to Pearson.

### 2.4 Processing Assessment Materials Returned by Schools

Pearson's receipt system provides for the logging of materials within 24 hours of receipt and the readiness of materials for scanning within 72 hours of receipt. District status is available from a web-based system accessible by SDE. In addition, the Oklahoma Call Center is able to provide receipt status information if required. The receipt notification website's database is updated daily to allow for accurate information being presented to inquiring district/school personnel. As with initial shipping, the secure and accurate receipt of test materials is a priority with Pearson. Quality assurance procedures provide that all materials are checked in using pre-defined procedures. Materials are handled in a highly secure manner from the time of receipt until final storage and shredding. The receipt of all secure materials is verified through the scanning of barcodes and the comparison of this data to that in security files established during the initial shipment of Oklahoma test materials to the district assessment coordinators.

## Section 3

## Classical Item Analysis and Results

This section provides an overview of the initial statistical analyses carried out for the 2011 administration of the OCCT. Following the administration of the OCCT, student demographic and item response data were transmitted to Pearson research scientists, who are responsible for the all statistical analyses for the OCCT. The classical analyses described in this section (as well the calibration and equating of each test) were conducted of near population level data (each subject had at least $85 \%$ of the student population represented before processing).

### 3.1 Data Receipt Activities

After all tests were scored, a data clean-up process that removed invalid cases, ineligible responses, and absent students was preformed for each test. Additionally, a statistical key check was also performed at this time. This 'cleaned’ sample was used for classical item analyses, calibration, and equating. Upon receipt of data, a Pearson research scientist inspected several data fields to determine if the data met expectations. This included screening the following variables:

- Student ID
- Demographic fields
- Form identification fields
- Raw item response
- Scored item response
- Total score and subscore fields
- Fields used to implement exclusion from analysis rules

Exclusion Rules. Following data inspection and clean-up, exclusionary rules were applied to form the final sample that was used for classical item analyses, calibration, and equating. Any student who had attempted at least five responses was included in the data analyses. The demographic breakdown of the students in Spring 2011 item analysis and calibration sample appears in Table 3.1.

Table 3.1. Demographic Characteristics of the Student Sample for Spring 2011

| Subject/Grade |  | Female | Male | African American | Native American | Hispanic | Asian | Pacific Islander | White | Other |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Statistical Key Check. Administering items that have only one correct key and are correctly scored is critical for accurate assessment of student performance. To screen for potentially problematic items, a statistical key check was conducted and items were flagged that met any of the following criteria:

- Less than 200 students responded to the item
- Correct response $p$-value less than 0.25
- Correct response uncorrected point-biserial correlation less than 0.20
- Distractor $p$-value greater than or equal to 0.40
- Distractor point-biserial correlation greater than or equal to 0.05

Any flagged operational items are submitted for key review by the appropriate Pearson content specialist. Any flagged items that are identified by content experts as having key issues are submitted to SDE for review before dropping the item from the operational scoring. There were no items identified in the Spring 2011 administrations as having a key issue. Once the keys were verified, classical item analyses were conducted.

### 3.2 Classical Item Analyses

Following completion of the data receipt activities and statistical key check, the following classical item analyses were conducted for operational and field test items:

- Percentage of students endorsing each multiple choice option (overall and broken down by gender and ethnicity)
- Overall p-value for each item
- Point-biserial correlation (overall and broken down by gender and ethnicity)
- Point-biserial for non-key response options (overall and broken down by gender and ethnicity)
- Omit percentage per item
- Mean score by response option (overall and broken down by gender and ethnicity)

The classical analysis of operational items is used as an additional quality control step to ensure that operational items are not behaving in an unexpected or aberrant manner. The Item analysis results of the operational items are reviewed by Pearson research Scientists and in the case of unexpected item performance, a course of action (e.g., retain item, drop form operational scoring) regarding the item(s) are recommended to SDE. In the 2011 administration, all operational items preformed adequately and were deemed appropriate for calibration and equating.

## 3.2.a Test-Level Summaries of Classical Item Analyses

The test-level raw score descriptive statistics for the calibration samples are shown in Table 3.2. Note that students whose tests were invalidated were excluded. The operational test results indicate that the omit rates were small for all assessments (grade three, which is administered as a consumable booklet, is slightly higher). In all cases, the average p -value ranged from 0.54 to 0.73 and average point biserial correlations ranged from 0.31 to 0.37 . In tandem, these summary statistics indicate sets of operational items that are functioning appropriately.

### 3.3 Procedures for Detecting Item Bias

One of the goals of the OSTP-OCCT 3-8 assessments is to assemble a set of items that provides a measure of a student's ability that is as fair and accurate as possible for all subgroups within the population. Differential item functioning (DIF) analysis refers to statistical procedures that assess whether items are differentially difficult for different groups of examinees. DIF procedures typically control for overall between-group differences on a criterion, usually total test scores. Between-group performance on each item is then compared within sets of examinees having the same total test scores. If the item is differentially more difficult for an identifiable subgroup when conditioned on ability, the item may be measuring something different from the intended construct. However, it is important to recognize that DIF-flagged items might be related to actual differences in relevant knowledge or skills or statistical Type I error. As a result, DIF statistics are used only to identify potential sources of item bias. Subsequent review by content experts and bias committees are required to determine the source and meaning of performance differences. For the OCCT DIF analyses, DIF statistics were estimated for all major subgroups of students with sufficient sample size: African American, Hispanic, Asian, Native American, and Female.

Field test items with statistically-significant differences in performance were flagged so that items could be carefully examined for possible biased or unfair content that was undetected in earlier fairness and bias content review meetings held prior to form construction.

Pearson used the Mantel-Haenszel (MH) chi-square approach for detecting DIF in multiple choice and open-ended items. Pearson calculated the Mantel-Haenszel statistic (MH D-DIF; Holland \& Thayer 1988) to measure the degree and magnitude of DIF. The student group of interest is the focal group, and the group to which performance on the item is being compared is the reference group. The reference groups for these DIF analyses were White for race and male for gender. The focal groups were females and minority race groups.

Items were separated into one of three categories on the basis of DIF statistics (Holland and Thayer 1988; Dorans and Holland 1993): negligible DIF (category A), intermediate DIF (category B), and large DIF (category C). The items in category C, which exhibit significant DIF, are of primary concern. The item classifications are based on the Mantel-Haenszel chisquare and the MH delta ( $\Delta$ ) value. Positive values of delta indicate that the item is easier for the focal group, and a negative value of delta indicates that the item is more difficult for the focal group. The item classifications are made as follows (Michaelides, 2008):

- The item is classified as C category if the MH D-DIF is significantly greater than 1.0 in absolute value, and its absolute value is at least 1.5.
- The item is classified as B category if the MH D-DIF is significantly different from zero, its absolute value is at least 1.0, and its absolute value is either less than 1.5 or not significantly greater than 1.0.
- The item is classified as A category if the MH D-DIF is not significantly different from zero ( $p \geq 0.05$ ), or if its absolute value is less than 1.0.

The data in Table 3.3 summarizes the number of items in DIF categories for the 17 multiple choice tests for the OCCT Spring 2011 administrations. The results presented in this table are for field test items only. Items flagged for DIF were placed before expert content specialist committees during the Spring 2011 field test data review (described below in the Section 3.4.) and items that were determined to exhibit bias as a result of the content of the item were removed from the item bank excluding them from future use.

### 3.4 Data Review

Data review represents a critical step in the test development cycle. At the data review meeting, SDE and Pearson staff had the opportunity to review actual student performance on the newly-developed and field-tested multiple choice items across the 17 subjects based on the Spring 2011 field test administration. The data review focused on the content validity, curricular alignment, and statistical functioning of field-tested items prior to selection for operational test forms. The field test results used in the data review provided evidence that the items were designed to yield valid results and were accessible for use by the widest possible range of students. The review of student performance should provide evidence regarding the fulfillment of requirement 200.2(b)(2)of NCLB. The purpose of the review meeting was to ensure that psychometrically-sound, fair, and aligned items are used in the construction of the OCCT 3-8 assessments and entered into the respective item banks. Pearson provided technical and psychometric expertise to provide a clear explanation about the content of the items, the field test process, the scoring process, and the resulting field test data to ensure the success of these meetings and the defensibility of the program.

## 3.4.a Data Review Materials and Meetings

Data review meetings were a collaborative effort between SDE and Pearson. SDE administrators and content specialists attended the meeting facilitated by Pearson content specialists and research scientists who trained the SDE staff on how to interpret and review the field test data. Meeting materials included a document explaining the flagging criteria, a document containing flagged items, and the item images. Pearson discussed with SDE the analyses performed and the criteria for flagging the items. Flagged items were then reviewed and decisions were made as to whether to accept the item, accept the item with revisions, or reject the item. Review of the data included presentation of $p$-value, point-biserial correlation, point-biserial correlation by response option, response distributions, mean overall score by response option, and indications of item DIF and IRT misfit. Items failing to meet the requirements of sound technical data were carefully considered for rejection by the review panel, thereby enhancing the reliability and improving the validity of the items left in the bank for future use. While the panel used the data as a tool to inform their judgments, the panel (and not the data alone) made the final determination as to the appropriateness or fairness of the assessment items. The flagging criteria for the OCCT assessments are as follows:

- $p$-value < . 25 or > . 90
- point-biserial correlation < . 20
- distractor point-biserial correlation > . 05
- differential item functioning (DIF): test item biases for subgroups
- IRT misfit as flagged by the Q1 index (see section 4.2)

Bias Review. One aspect of the data review meetings was to assess potential bias based on DIF results and item content. Although bias in the items had been avoided through writer training and review processes, there is always the potential for bias to be detected through statistical analysis. It is important to include this step in the development cycle because SDE and Pearson wish to avoid inclusion of an item that is biased in some way against a group, because the item may lead to inequitable test results. As described earlier, all field test items were analyzed statistically for DIF using the field test data. A Pearson research scientist explained the meaning, in terms of level, and the direction of the DIF flags. The data review panel reviewed the item content, the percentage of students selecting each response option, and the point-biserial correlation for each response option by gender and ethnicity for all items flagged for DIF. The data review panel was then asked if there was context (for example, cultural barriers) or language in an item that might result in bias (i.e., an explanation for the existence of the statistical DIF flag).

## 3.4.b Results of Data Review

The number of items inspected during data review as a result of the item meeting the statistical flagging criteria for the classical item analyses, DIF, and IRT procedures is presented in Table 3.4.

Table 3.4. Number of Items Per Subject Flagged and Rejected During Spring 2011 Field Test Data Review

| 3.5 Test Reliability |  |  |  |  |  |  |

The reliability of a test provides an estimate of the extent to which an assessment will yield the same results when administered in different times, locations, or samples, when the two administrations do not differ in relevant variables. The reliability coefficient is an index of consistency of test results. Reliability coefficients are usually forms of correlation coefficients and must be interpreted within the context and design of the assessment and of the reliability study. Cronbach's alpha is a commonly-used internal consistency measure, which is derived from analysis of the consistency of the performance of individuals on items in a test administration. Cronbach's alpha is calculated as shown in equation (1). In this formula, $s_{i}{ }^{2}$ denotes the estimated variance for each item, with items indexed $i=1,2, \ldots k$, and $s_{\text {sum }}^{2}$ denotes the variance for the sum of all $k$ items:

$$
\begin{equation*}
\alpha=\left(\frac{k}{k-1}\right)\left(1-\frac{\sum_{i=1}^{k} s_{i}^{2}}{s_{\text {sum }}^{2}}\right) . \tag{1}
\end{equation*}
$$

Cronbach's alpha was estimated for each of the content areas for the operational portion of the test.

Table 3.5 presents Cronbach's alpha for the operational tests by subject area for the Spring 2011 OCCT administration. These reliability coefficients indicate that the OSTP-OCCT assessments had strong internal consistency and that the tests produce relatively stable scores. Additionally, Table 3.5 shows the reliability analysis results by the different reporting subgroups for the OSTP-OCCT assessments for Spring 2011 for the operational items. In all instances, the reliability coefficients are well above the accepted lower limit of .70, with most values near .90.

### 3.6 Analysis of the Writing Tests

The administration of the spring 2011 Writing assessment took place on March 9, 2011. Students at Grades 5 and 8 were given one operational writing prompt. The following sections describe the statistical analyses conducted to place the 2011 operational writing prompts on the scale established in 2006.

## 3.6.a Prompt Scoring

The writing score is a weighted composite of five analytic scores that focus on specific domains of writing skills. These skills are listed in Table 3.6. Each student's response to a prompt is read by two independent raters; the raters' scores for each domain are averaged. The domain scores range from 1 (the lowest score) to 4 (the highest score).

Table 3.7. Test Reliability by Subgroup for Spring 2011

Writing Analytic Traits
Ideas and Development (ID)
Organization, Unity, and Coherence (OUC)
Word Choice (WC)
Sentences and Paragraphs (SP)
Grammar, Usage, and Mechanics (GUM) Weight
30\%
25\%
15\%
15\%
15\%

The raw composite score (RCS) is calculated as a weighted composite of the average of two independent ratings for each of the five analytic traits:

$$
\begin{equation*}
R C S=15 *(0.30 * I D+0.25 * \mathrm{OUC}+0.15 * \mathrm{WC}+0.15 * \mathrm{SP}+0.15 * \mathrm{GUM}) \tag{2}
\end{equation*}
$$

OSTP-OCCT 3-8 Spring 2011 operational writing prompts are within the moderate range.

## 3.6.b Adjustment for Rater-Year Effects

The baseline for each grade's operational writing scale was 2006. To place the 2011 operational prompts on the 2006 scale, transformation constants were obtained to adjust RCS scores for prompt difficulty and for rater-year effects relative to a target distribution. All calculations were performed on the RCS prior to rounding. For reporting, the scaled composite scores (SCS) were then rounded to the nearest integer between 15 and 60 . For each of the 2007 field-test prompts, ETS provided a set of unique transformation constants to adjust for both prompt difficulty and rater-year effects. Based on ETS' report, OCCT Writing: Scaling the 2007 Field-Test Prompts (ETS, 2007), the following equation was used to adjust the 2010 raw composite scores:

$$
\begin{equation*}
S C S_{11}=B_{07}\left(R C S_{11}\right)+A_{07} \tag{3}
\end{equation*}
$$

Where SCS $_{1}$ represents the scaled composite score after adjusting the 2011 prompt to the 2007 scale.

In 2011, Pearson also performed a rater drift to adjust for the difference in raters between the 2007 administration to the current administration. Pearson's Performance Scoring Center (PSC) randomly scored approximately 500 student responses from 2007 for each grade's prompt and distributed these into the current administration scoring throughout the entire scoring window. The student responses were pulled by lithocode and were only the valid scored responses (i.e., no condition codes such as off-topic present). The rescored prompts where then linked to their original 2007 scores and formed the basis for a second set of linear scaling constants.
The 2011 rater effect constants $\left(C_{11} \& D_{11}\right)$ were determined by using the means $(M)$ and standard deviations $(\mathrm{S})$ of the 2007 raw composite scores and the 2011 rescored raw composite scores as calculated below for each grade.

$$
\begin{gather*}
D_{11}=S_{07} / S_{11}  \tag{4}\\
C_{11}=M_{07}-\left(M_{11} * D_{11}\right) \tag{5}
\end{gather*}
$$

Because both are corrected due to raters and a rescaling to the 2007 scale is desired, a compound adjustment-using both sets of constants-is required. Final composite scores where created using the formula below:

$$
\begin{equation*}
S C S_{11}=B_{07}\left[\left(D_{11} * R C S_{11}\right)+C_{11}\right]+A_{07} \tag{6}
\end{equation*}
$$

Table 3.8 provides the resulting score distribution statistics with no adjustment, only the ETS adjustment, and the compound adjustment. Transformation constants are provided at the bottom of the Tables.

Table 3.9. Results of Grades 5 and 8 Writing Prompt Scoring and scaling

## 3.6.c Inter-rater reliability

Inter-rater reliability is referred to as the degree of agreement among scorers that allows for the scores to be interpreted as reasonably intended by the test developer (AERA, APA and NCME, 1999). Raters for the grade 5 and 8 Writing assessments were trained to implement the scoring rubrics, anchor papers, check sets, and resolution reading. The items were analytically scored by two raters on five strands in both administrations. The final writing score for a student in a given strand is the average of the two scores. The inter-rater reliability coefficients for the operational prompt are presented in Error! Reference source not found. The results show that exact and adjacent rater agreement on trait scores for both the grade 5 and 8 operational writing prompts were reasonably high. The weighted Kappa statistic (Kraemer, 1982) is an indication of inter-rater reliability after correcting for chance. The Kappa values for the OCCT grade 5 and 8 Writing assessment's writing prompts are close to or within the moderate range.

Table 3.10. Inter-rater Reliability for Grade 5 and 8 Writing Prompts for Spring 2011

| Trait | Max Points | Valid N | Point Discrepancy Percentages |  |  |  |  |  |  | Agreement Percentages |  |  | Kappa |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Section 4

## Calibration, Equating, and Scaling

### 4.1 Item Response Theory (IRT) models

Dichotomous Item Response Theory Model. The three-parameter logistic (3-PL) item response theory (IRT) model (Lord \& Novick, 1968) was used for calibrating the dichotomously-scored multiple choice items. In the 3-PL model (Lord, 1980), the probability that a student with an ability level of $\theta$ responds correctly to item $i$ is

$$
\begin{equation*}
P_{i}(\theta)=c_{i}+\left(1-c_{i}\right) \frac{1}{1+e^{-D a_{i}\left(\theta-b_{i}\right)}}, \tag{7}
\end{equation*}
$$

where $a_{i}$ is the item discrimination parameter, $b_{i}$ is the item difficulty parameter, $c_{i}$ is the lower asymptote parameter, and $D$ is a scaling constant, which is traditional equal to 1.7. With multiple-choice items it is assumed that, due to guessing, examinees with very low ability levels have a probability greater than zero of responding correctly to an item. This probability is represented in the $3-\mathrm{PL}$ model by the $c_{i}$ parameter.

The fitting of the IRT models to the 2011 assessment data were implemented using MULTILOG 7.0 (Thissen, Chen, \& Bock, 2003). MULTILOG estimates parameters simultaneously for dichotomous items via marginal maximum likelihood procedures. All item and student ability calibrations were independently conducted and verified by at two Pearson research scientists.

### 4.2 Assessment of IRT Fit to the model

Item fit was assessed using the Yen's $(1981,1984) Q_{1}$ item fit index, which approximately follows a $\chi^{2}$ distribution:

$$
\begin{equation*}
Q_{1 i}=\sum_{r=1}^{10} \frac{N_{r}\left(O_{i r}-E_{i r}\right)^{2}}{E_{i r}\left(1-E_{i r}\right)}, \tag{8}
\end{equation*}
$$

where $Q_{1 i}$ is the fit of the $i$ th item, $N_{r}$ is the number of examinees per cell, $O_{i r}$ is the observed proportion of examinees in cell $r$ that correctly answered item $i$, and $E_{i r}$ is the expected portion of examinees in cell $r$ that correctly answered item $i$. The expected proportions are computed using ability- and item parameter estimates in Equations (7) and summing over examinees in cell $r$ :

$$
\begin{equation*}
E_{i r}=\frac{1}{N_{i r}} \sum_{k s r}^{N_{i r}} P_{i}\left(\hat{\theta}_{k}\right) \tag{9}
\end{equation*}
$$

Because chi-square statistics are affected by sample size and associated degrees of freedom, the following standardization of the $Q_{1}$ statistic was used:

$$
\begin{equation*}
Z_{j}=\frac{Q_{1 i}-d f}{\sqrt{(2 d f)}} \tag{10}
\end{equation*}
$$

The Z-statistic is an index of the degree to which observed proportions of item scores are similar to the proportions that would be expected, given the estimated ability- and item parameters. Large differences between expected and observed item performance may indicate poor item fit. To assess item fit, a critical $Z$-value is determined. Items with $Z$-values that are larger than this critical $Z$-value have poor item fit. The item characteristic curves, classical item statistics, and item content were reviewed for items flagged by $Q_{1}$. An internally-developed software program, Q1Static, was used to compute the $Q_{1}$ item fit index.

Operational items flagged by $Q_{1}$ that were not flagged by the classical item statistics and had reasonable IRT parameter estimates were not reviewed further. If any operational items were also flagged by classical item statistics and/or had poor IRT parameter estimates (e.g., low a parameter), the items were reviewed by Pearson content specialists. Any item that was potentially mis-keyed was presented to SDE to make a decision regarding whether to keep or remove the item. A total of two operational items (one grade 3 Mathematics item and one Grade 8 Social Studies Item) were flagged as potentially misfitting, but showed no other evidence of aberrant behavior, and were not sent for further review.

Field Test Items. The field test items across all subjects were evaluated using the $Q_{1}$ statistic to evaluate the extent to which the obtained proportions of item scores are close to the proportions that would be expected based on the estimated thetas and item parameters. Any field test items flagged by $Q_{1}$ were included in the data review for review by contest specialists from Pearson and SDE (for more on data review, please see Section 0).

### 4.3 Calibration and Equating

The 3-PL model was used for calibration of all multiple choice items. A common item, nonequivalent groups (CINEG) design was used for all content areas to link the current test forms the base scale. Typically, for the CINEG design common, or anchor, items are selected to be representative of the test content in terms of difficulty and the test blueprint. The Stocking and Lord (1983) procedure, which estimates the equating transformation constants by minimizing the distance between the test characteristic curves of the common items, was used to equate the tests to the base year. Equating was conducted employing using freelyavailable software, STUIRT (Kim \& Kolen, 2004). Prior to conducting the equating, anchor item stability checks were performed to eliminate the impact of item drift on equating.

### 4.4 Anchor items and Anchor Stability Evaluation Methods

Table 4.1 presents the number and percentage of anchor items (before and after anchor stability checks) by subject and grade for the Spring 2011 administration. The anchor set was comprised of at least $20 \%$ of all operational items (counts vary by subject/grade). In addition, the linking set was proportionally representative of the total test in terms of content assessed and mimicked the difficulty of the overall test as well.

Table 4.1. Number of Linking Items Per Subject for Spring 2011

| Subject | Grade | $\begin{array}{c}\text { Operational } \\ \text { Items }\end{array}$ | $\begin{array}{c}\text { Initial } \\ \text { Anchor Set }\end{array}$ | Final Anchor |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Set |  |  |  |  |  |$]$

Despite the careful selection and placement of the operational items to be used as anchor items to link the 2011 test to the bank scale, it is possible for these items to perform differentially across administrations. Dramatic changes in item parameter values can result in systematic errors in equating results (Kolen \& Brennan, 2004). As a result, prior to finalizing the equating constants, Pearson evaluated changes in the item parameters from the item bank to the Spring 2011 administration. The process used in this evaluation is called an anchor stability check.

The anchor item parameter stability check that Pearson performed is an iterative approach, which uses a method that is similar to the one used to check for differential item functioning. This method is called the $d^{2}$ procedure. The steps taken were as follows:

1) Use a theoretically-weighted posterior $\theta$ distribution, $g\left(\theta_{k}\right)$, with 40 quadrature points.
2) Place the current linking item parameters on the baseline scale by computing Stocking \& Lord (SL) constants using STUIRT and all ( $k$ ) linking items.
3) Apply the SL linking constants to the current item parameters and compute the current raw score to scale score table. The results based on all $k$ linking items will comprise the original table.
4) For each item, calculate the weighted sum of the squared deviation ( $\mathrm{d}^{2}$ ) between the two Item Characteristic Curves-one ICC for each set of parameters.
a) For each item calculate a weighted sum of the squared deviation between the ICCs based on old ( x ) and new ( y ) parameters at each point in this theta distribution.

$$
\begin{equation*}
d_{i}^{2}=\sum^{k}\left[P_{i x}\left(\theta_{k}\right)-P_{i y}\left(\theta_{k}\right)\right]^{2} \bullet g\left(\theta_{k}\right) \tag{11}
\end{equation*}
$$

b) Review and sort the items in a descending (largest to smallest) fashion according to the $\mathrm{d}^{2}$ estimate.
c) Drop the items with the largest $\mathrm{d}^{2}$ item from inclusion in the anchor set.
5) Repeat steps 2 through 3 until 10 items are dropped. This will result in 11 raw score to scale score tables.
6) Compare each RSSS table with the RSSS based on the use of one less anchor item. When two adjacent RSSS tables no longer differ in performance classification at each of the cut score points, the anchor set is considered stable. The constants used to generate the RSSS based on the largest number of anchor items when stability is achieved should be retained as the final SL constants.

Before removing any item from the item parameter stability check, the following additional characteristics were examined: 1) prior and current year $p$-values and point-biserial correlations, 2) prior and current year IRT parameter estimates, 3) prior and current year item sequence, 4) standard and objective/skill of the item, 5) impact on blueprint representation, 6) passage ID/title for items linked to a stimulus, and 7) content review of the actual item. Decisions about whether to keep or remove an item were evaluated on a per item basis. If an item (note, only one item can be removed at a time) was removed from the, the process (beginning at the equating step) was be repeated until there were no further items to be removed (the raw score to scale score table has stabilized or the item is judged that it should be included in the equating set; for example, a portion of the blueprint is not represented if the item is removed).

Once the anchor set was finalized, the equating constants obtained from the final Stocking and Lord (1983) run were applied to the non-anchor operational items for computation of raw score to scale score tables. Table 4.1 show she final number of anchor items used for equating for OCCT each test. Any item removed from the anchor parameter stability check set still contributed to student scores.

### 4.5 Scaling and Scoring Results

The Lowest Obtainable Scale Score (LOSS), Highest Obtainable Scale Score (HOSS), and final scaling constants for each of the subjects are shown in Table 4.4. The scaling constants, M1 (multiplicative) and M2 (additive), place the true scores associated with each raw score point onto the reporting or operational scale using a straightforward linear transformation:

$$
\begin{equation*}
\text { Scale Score }=(\hat{\tau} \times M 1)+M 2 \tag{12}
\end{equation*}
$$

where, $\hat{\tau}=$ true score.
The raw score to number-correct scale scores were generated from equated parameter estimates using a freely-available software program, POLYEQUATE (Kolen, 2004). Each scale score on the assessment is associated with a performance level that describes the types of behavior, knowledge, and skill a student in this score level is likely to be able to do. For the

OCCT 3-8 assessments, there are three cut scores that divide scores into four performance levels: Unsatisfactory, Limited Knowledge, Proficient (or Satisfactory), and Advanced. The cut scores for each of the tests appear in Error! Reference source not found.. In addition, a conditional standard error of measurement (CSEM; please see Section 6.3 for computation of CSEM) was computed for each of the raw score points. The resulting raw score to scale score conversions, CSEMs, as well as the performance levels for are shown in Table 4.2 to Table 4.3 for Spring 2011. RSSS tables for writing are not included in the list of tables as the there no further transformation of the composite score beyond that described in section 3.6.

Table 4.4. LOSS, HOSS, and Scaling Constants by Subject

## Section 5

## Classification Consistency and Accuracy Studies

### 5.1 Classification Consistency and Accuracy

Every test administration will result in some error in classifying examinees. The concept of the standard error of measurement (SEM) has implications for the interpretation of cut scores used to classify students into different performance levels. For example, a given student may have a true performance level greater than a cut score; however, due to random variations (measurement error), the student's observed test score may be below the cut score. As a result, the student may be classified as having a lower performance level. As discussed in Section 6.4, a student's observed score is most likely to fall within a standard error band around his or her true score. Thus, the classification of students into different performance levels can be imperfect; especially for the borderline students whose true scores lie close to the performance level cut scores.

According to Livingston and Lewis (1995, p. 180), the accuracy of a classification is "the extent to which the actual classifications of the test takers... agree with those that would be made on the basis of their true score" and are calculated from cross-tabulations between "classifications based on an observable variable and classifications based on an unobservable variable." Since the unobservable variable-the true score-is not available, Livingston and Lewis provide a method to estimate the true score distribution of a test and create the crosstabulation of the true score and observed variable (raw score) classifications. Consistency is "the agreement between classifications based on two non-overlapping, equally-difficult forms of the test" (p. 180). Consistency is estimated using actual response data from a test and the test's reliability to statistically model two parallel forms of the test and compare the classifications on those alternate forms. There are three types of accuracy and consistency indices that can be generated using Livingston and Lewis' approach: overall, conditional on level, and by cut score.

The overall accuracy of performance level classifications is computed as a sum of the proportions on the diagonal of the joint distribution of true score and observed score levels. Essentially, overall accuracy is a proportion (or percentage) of correct classifications across all levels. The overall consistency index is computed as the sum of the diagonal cells in a consistency table. Another way to express overall consistency is to use the kappa coefficient, as used in the inter-rater reliability studies in Section Error! Reference source not found. . Like the inter-rater reliability studies, kappa provides an estimate of agreement or the proportion of consistent classifications between two different tests after taking into account chance.

Consistency conditional on performance level is computed as the ratio between the proportion of correct classifications at the selected performance level (for example, proficient students who were classified as proficient) and the proportion of all the students classified into that level (total proportion of students who were considered proficient). Accuracy conditional on performance level is computed in a similar manner except that in the consistency table where both row and column marginal sums are the same, the accuracy table uses the sum based on estimated status as the total for computing accuracy conditional on performance level.

To evaluate decisions at specific cut scores, the joint distribution of all the performance levels are collapsed into dichotomized distributions around that specific cut score (for example collapsing Unsatisfactory and Limited Knowledge and then Proficient and Advanced to assess decisions at the Proficient cut score). The accuracy index at a cut score is computed as the sum of the proportions of correct classifications around this selected cut score. The consistency at a specific cut score is obtained in a similar way, but by dichotomizing the distributions at the cut score performance level and between all other performance levels combined. Table 5.1 for Spring 2011 present the overall accuracy and consistency indices for all of the OCCT 3-8tests.

Table 5.1. Estimates of Accuracy and Consistency of Performance Classification

| Subject | Grade | Accuracy | Consistency | Kappa(K) | False <br> Positive | False <br> Negative |

| SCIENCE | 5 | 0.76 | 0.68 | 0.43 | 0.11 | 0.13 |
|  | 8 | 0.83 | 0.77 | 0.52 | 0.07 | 0.10 |
| SOCIAL | 5 | 0.76 | 0.67 | 0.52 | 0.12 | 0.12 |
|  | 7 | 0.77 | 0.69 | 0.44 | 0.13 | 0.10 |
|  | 8 | 0.81 | 0.73 | 0.55 | 0.10 | 0.09 |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |

As shown in Table 5.1the overall accuracy indices range between 73 and 83 percent and overall consistency ranging between 64 and 77 for the Spring 2011 OCCT administration. Kappa coefficients range from 0.43 and 0.55 in Spring 2011. The rate of false positives range from 7 to 21 and false negative rates range from 7 to 13 percent for the Spring 2011 administration.

Table 5.2 provides the accuracy, consistency, false positive, and false negative rates by cut score for Spring 2011. The data in these tables reveal that the level of agreement for both accuracy and consistency is above 80 percent in all cases, with most above 90 percent. In general, the high rates of accuracy and consistency support the cut decisions made using these assessments. Similar to Table 5.1, the false positive and false negative rates were comparable for the Spring 2011 administrations and are quite low.

The importance of the dichotomous categorization is particularly notable when they map onto proficient/not proficient decisions for the assessments. For the OCCT 3-8 tests, the U+L/P +A is the important dichotomization, because it directly translates to the proficient/not proficient decision point, which is important in computing Adequate Yearly Progress (AYP). Similar to other dichotomization distinctions, there are three main scenarios at this cut point: 1) observed performance is accurately reflective of the true ability level (i.e., the examinee is proficient and should have being proficient); 2) the true ability level is below the standard, but the observed test score is above the standard (i.e., a false positive); and 3) the true ability level is above the standard, but the observed test score is below the standard (i.e., a false negative). In examining Table 5.2, for example, 93 percent of grade 3 Mathematics students were correctly classified as proficient or not proficient based on their performance (scenario 1), 3 percent were considered proficient but their true performance is below the standard (scenario 2), and 4 percent were not considered proficient although their true performance is above the standard (scenario 3). Overall, the rates for accurate classification are above $85 \%$ for the administrations for all subjects - students are appropriately (more than $85 \%$ of the time) categorized into proficient/not proficient classifications based on their true ability using their observed score (raw score) as their classification score.

Table 5.2. Accuracy and Consistency Estimates and False Positive/False Negative Rates by Cut Score

| Subject | Grade | Accuracy |  |  | Consistency |  |  | False Positive |  |  | False Negative |  |  |

Note: U =Unsatisfactory; L = Limited Knowledge; P = Proficient; and A = Advanced.
Note: U / L+P+A = Unsatisfactory divided by Limited Knowledge plus Proficient plus Advanced; U+L / P+A = Unsatisfactory plus Limited Knowledge divided by Proficient plus Advanced; U+L+P / A = Unsatisfactory plus Limited Knowledge plus Proficient divided by Advanced.

## Section 6

## Summary Statistics

### 6.1 Descriptive Statistics

The summary descriptive statistics of the scale scores for Spring 2011 appears in Table 6.1 through Error! Reference source not found. . The scales scores presented exclude invalid student cases and second-time testers.

### 6.2 Performance Level Distribution

The distributions of students in the four performance levels based on student performance in the Spring 2011 administration are presented in Table 6.5 (please see Appendix B). As above, these percentages exclude invalid student data. The percentage distributions for each of the content areas are comparable to previous administrations (e.g., Spring 2010).

Table 6.5. Percentage of Students by Performance Level for Spring 2011

| Subject/Grade | N | Unsatisfactory | Limited Knowledge | Proficient | Advanced |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 6.3 Conditional Standard Error of Measurement

The conditional standard error of measurement (CSEM) was computed for each reported scale score. CSEM was computed using an IRT-based approach based on the following formula:

$$
\begin{equation*}
\operatorname{CSEM}\left(O_{X} \mid \theta\right)=\sqrt{\left[\sum_{X=0}^{\operatorname{MaxX}} O_{X}^{2} p(X \mid \theta)\right]-\left[\sum_{X=0}^{\operatorname{MaxX}} O_{X} \cdot p(X \mid \theta)\right]^{2}} \tag{13}
\end{equation*}
$$

where $O_{\mathrm{x}}$ is the observed scaled score for a particular number-correct score $X, \theta$ is the IRT ability scale value conditioned on, and $p(\bullet)$ is the probability function. Pearson has implemented a computational approach for estimating $\operatorname{CSEM}\left(O_{\mathrm{x}} \mid \theta\right)$ in which $p(X \mid \theta)$ is
computed using a recursive algorithm given by Thissen, Pommerich, Billeaud, and Williams (1995). This algorithm is a polytomous generalization of the algorithm for dichotomous items given by Lord and Wingersky (1984). The values of $\theta$ used with the algorithm are obtained through the true score equating process (i.e., by solving for $\theta$ through the test characteristic curve for each number-correct score, $X$ ). There is one CSEM per number-correct score. The CSEMs by subject appear Tables 6.6 to 6.7 for the Spring 2011 administration of the OCCT.

### 6.4 Standard Error of Measurement

Measurement error is associated with every test score. A student's true score is the hypothetical average score that would result if the student took the test repeatedly under similar conditions. The standard error of measurement (SEM), as an overall test-level measure of error, can be used to construct a range around any given observed test score that likely includes the student's true score. SEM is computed by taking the square root of the average value of the variances of the error of measurement associated with each of the raw score or scales scores:
where,

$$
\begin{equation*}
S E M=\sqrt{\frac{\sum_{j}\left(\text { CSEM }_{j}^{2} \cdot N_{j}\right)}{N_{T}}} \tag{14}
\end{equation*}
$$

SEM was computed for each of the content areas. Table 6.8. presents the overall estimates of SEM for each of the content areas for the Spring 2011 administration.

Table 6.9. Overall Estimates of SEM by Test

[^0]:    ${ }^{1}$ The grade 6 math test was an exception to this format. The grade 6 math assessment contained a single operational core and 11 field-test forms. Due to changes in the OCCT mathematics test blueprints and a realignment of the PASS standards in 2010-11, some objectives and skills had no operational items available for use on the 2011 operational forms. Three field-test items from underrepresented objectives were placed on all forms. Each of the 11 forms also contained seven fieldtest items unique to the form.

[^1]:    ${ }^{2}$ The Mathematics PASS standards were revised in 2009-2010 and required significant changes to the test blueprints, and thus required significant changes to the OCCT Mathematics item bank. The test administered in 2011 was the first time the new standards were assessed, and Pearson assisted in the setting of new performance standards in the summer of 2011.
    ${ }^{3}$ While the Reading PASS standards that are assessed by OCCT are the same, the enumeration of these standards is slightly different in grade 3.
