Oklahoma School Testing Program
Oklahoma Core Curriculum Tests

## Grades 3 to 8 Assessments

## 2012 Technical Report

Submitted to
The Oklahoma State Department of Education
August 2012

## Executive Summary

## Introduction

The Oklahoma Core Curriculum Tests (OCCT) is one component of the Oklahoma School Testing Program (OSTP). The OCCT is a state-wide criterion referenced assessment program that includes tests of Mathematic and Reading in grades 3 through 8; Science in grades 5 and 8; Social Studies in grades 5, 7 (Geography), and 8 (U.S. History, Constitution, and Government); and Writing in grades 5 and 8. Each test is designed as a measure of a student's knowledge relative to the Priority Academic Student Skills (PASS), Oklahoma's content standards.

The OCCT tests of Writing were administered on February 21-22, 2012. Five tests-grade 7 Geography, grades 7 and 8 Mathematics, and grades 7 and 8 Reading are primarily computer delivery (a paper form is also available), and were administered during the online test window from April 10, 2012 to May 4, 2012. The remaining tests were administered via paper between April 10, 2012 and April 24, 2012. This report provides technical details of work accomplished through the end of 2012 on all of these tests.

## Purpose

The purpose of this Technical Report is to provide objective information regarding technical aspects of the OSTP-OCCT 3-8 assessments. This volume is intended to be one source of information to Oklahoma K-12 educational stakeholders (including testing coordinators, educators, parents, and other interested citizens) about the development, implementation, scoring, and technical attributes of the OCCT 3-8 assessments. Other sources of information regarding this battery of tests include the administration manuals, interpretation manuals, student-, teacher-, and parent guides, implementation materials, and training materials.

The information provided here fulfills legal, professional, and scientific guidelines (AERA, APA, \& NCME, 1999) for technical reports of large-scale educational assessments and is intended for use by qualified users within schools who use the OSTP-OCCT 3-8 assessments and interpret the results. Specifically, information was selected for inclusion in this report based on NCLB requirements and the following Standards for Educational and Psychological Testing:

- Standards 6.1-6.15 Supporting Documentation for Tests
- Standards 10.1-10.12 Testing Individuals with Disabilities
- Standards13.1-13.19 Educational Testing and Assessment

This technical report provides accurate, complete, current, and clear documentation of the OSTP-OCCT 3-8 development methods, data analysis, and results as is appropriate for use by qualified users and technical experts. Section 1 provides an overview of the test design, test content, and content standards. Section 2 provides summary information about the test administration. Section 3 details the classical item analyses and reliability results, and Section 4 details the calibration, equating, scaling analyses, and results. Section 5 provides the results of the classification accuracy and classifications studies. Finally, Section 6 provides higher-level summaries of all the tests included in the OSTP-OCCT 3-8 testing program.

Information provided in this report presents valuable information about the OSTP-OCCT 3-8 assessments regarding:

1. Content standards,
2. Content of the tests,
3. Test form design,
4. Administration of the tests,
5. Identification of ineffective items,
6. Detection of item bias,
7. Reliability of the tests,
8. Calibration of the tests,
9. Equating of tests,
10. Scaling and scoring of the tests, and
11. Decision accuracy and classification.

Each of these facets in the OSTP-OCCT 3-8 assessments development and use cycle is critical to the validity of test scores and interpretation of results. This technical report covers all of these topics for the 2011-12 testing year.

## Section 1

## Overview of the Oklahoma School Testing Program (OSTP) Oklahoma Core Curriculum Tests (OCCT) for Grades 3 to 8

The Oklahoma Core Curriculum Tests are state-mandated, criterion-referenced tests used to assess student proficiency. In the spring of 2012, the OCCT assessments were administered to all eligible public school students in grades 3 through 8 . Currently, this assessment program includes tests of Mathematics and Reading in grades 3 through 8, Science and Writing in grades 5 and 8 , and Social Studies in grades 5, 7, and 8 . The 2012 administration of the OCCT was the $17^{\text {th }}$ for students in grades 5 and 8 and the $7^{\text {th }}$ for students in grades 3,4 , and grade 7 Social Studies (Geography). This was the $7^{\text {th }}$ operational administration of the Reading and Mathematics tests in grades 6 and 7.

All 19 assessments are designed to measure student performance relative to a specific set of academic skills established by committees of Oklahoma educators. This set of skills-the Priority Academic Student Skills (PASS)-represents skills that students are expected to master by the end of each grade for each subject. The OCCT are untimed tests, and with the exception of the writing assessment, which is a single open-ended written response to a prompt, student performance is measured exclusively by multiple choice (MC) items. The MC tests in grades 3 through 5 are administered in two sessions. All tests in grades 6 through 8, as well as the grade 5 writing test, are administered in a single session. The grades 7 and 8 Mathematics and Reading tests, as well as the grade 7 Geography tests were primarily computer delivered (paper forms were available only for make-ups or for test test-takers with accommodations requiring a paper form). Tests for all other grades and subjects were administered exclusively in paper and pencil format.

Pearson content specialists and research scientists worked with the Oklahoma State Department of Education (SDE) to construct OCCT test forms aligned to the PASS standards. In each test, a form consisted of a set of operational items used to produce student test scores and a set of embedded field-test items. The two Writing assessments consisted of a single constructed-response (CR) item. The operational set of items for the Reading, Mathematics, Science, and Social Studies assessments were composed of Multiple-Choice (MC) items only. For each subject and grade, there were between eight and twelve forms consisting of a common set of operational items and a unique set of 10 field-test items. Responses to the operational items were used to produce student scores. Responses to the field-test items were used to evaluate the psychometric properties of these newly developed items for possible inclusion on future forms. In addition to the regular operational form, an equivalent form was designated for all Mathematics and Reading tests as well as grade 7 Geography, and a Braille version of each 2012 operational form was created as well. A student could receive an equivalent form for various reasons, including becoming ill during test administration or experiencing some kind of security breach. The State Department of Education Office of Accountability and Assessments determines eligibility for an equivalent form on a case-by-case basis. Responses for students who took an equivalent form were scored and reported using the scoring tables from the form's previous administration.

### 1.1 Content Assessed by the OCCT

The OCCT is developed with the expressed purpose of measuring the Oklahoma PASS content standards. In some cases, the PASS standards contain objectives that are not easily assessed in a large-scale and standardized format (e.g., English-Language Arts PASS standards include listening, reviewing). Standards that are not assessed using the OCCT must be assessed by school districts locally. A complete listing of all standards and objectives for all subjects and grades (measured and unmeasured) can be found on the SDE website: http://www.ok.gov/sde/test-support-teachers-and-administrators.

A list of the testable standards for each subject is provided in Table 1-1. For Math ${ }^{1}$ and Reading ${ }^{2}$, the same testable standards appear in each grade level.

The tables in Appendix A provide information drawn from the 2012 PASS blueprints. These tables show the PASS standards, objectives, skills, and processes, as well as the number of items allocated to each standard, objective/skill and/or process according to the blueprint and actual number of items appearing on the 2012 operational form.

| Standard 7./8. | Standard 9. |

### 1.2 Summary of Test Development and Content Validity

To ensure content validity of the OCCT tests, Pearson content specialists closely study the Oklahoma Priority Academic Student Skills (PASS) and work with Oklahoma content area specialists, teachers, and assessment experts to develop a pool of items that measure Oklahoma's assessment frameworks (i.e., PASS) for each subject. Once the need for field test items was determined, based on the availability of items for future test construction, a pool of items that measured Oklahoma's PASS in each subject was developed. These items were developed under universal design guidelines set by the SDE and were carefully reviewed and discussed by content and bias/sensitivity review committees to evaluate not only content validity, but also plain language and the quality and appropriateness of the items. These committees were comprised of Oklahoma teachers and SDE staff. The committees' recommendations were used to select and/or revise items from the item pool used to construct the field test portions of the Spring 2012 assessments.

## 1.2.a Aligning Tests to PASS Content Standards

In addition to the test blueprints provided by SDE (see Appendix A), Table 1-2 describes five criteria for test alignment with the PASS Standards and Objectives.

Table 1-2. Criteria for Aligning the Test with PASS Standards and Objectives.

|  | The test is constructed so that there are at least six <br> items measuring each PASS standard. The number of <br> items is based on estimating the number of items that <br> could produce a reasonably reliable estimate of a <br> student's mastery of the content measured. |
| :--- | :--- |
| 2. Categorical ConcurrenceDepth of Knowledge  <br> Consistency The test is constructed using items from a variety of <br> Depth of Knowledge levels that are consistent with the <br> processes students need in order to demonstrate <br> proficiency for each PASS objective. <br> 3. Range of Knowledge The test is constructed so that at least 75\% of the <br> objectives for a PASS standard have at least <br> one corresponding assessment item. <br> Correspondence The test is constructed according to the test blueprint, <br> which reflects the degree of representation given on the <br> test to each PASS standard and/or objective in terms of <br> the percent of total test items measuring each standard <br> and the number of test items measuring each standard <br> and/or objective. The test construction shall yield a <br> balance of representation with an index of 0.7 or higher <br> of assessed objectives related to a standard. <br> 4. Balance of Representation  |  |
| Each test item is constructed in such a way that the <br> major cognitive demand comes directly from the |  |
| 5. Source of Challenge | targeted PASS objective or concept being assessed, not <br> from specialized knowledge or cultural background of the <br> test-taker. |

## 1.2.b Additional Considerations in Item Selection

The source of the operational items eligible for inclusion on the Spring 2012 form is a pool of previously field-tested or operationally-administered items ranging from the Spring 2005 through the Spring 2011 administrations. In each case, items were calibrated using live data from the operational administrations to estimate parameters for these items.

To equate the forms across years, a set of operational items served as anchors or links to the base scale. Equating is necessary to account for slight year-to-year differences in form difficulty and/or student achievement and to maintain comparability across years. Details of the equating procedures applied are provided in a subsequent section in this document. Content experts also targeted the percentage of items measuring various Depth of Knowledge (DOK) levels for assembling the tests. Table 1-3 provides the DOK level percentages for the Spring 2012 operational assessments.

Table 1-3. Percentage of Items by Depth of Knowledge Levels

|  |  | DOK Level |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\mathbf{1}$ |  | $\mathbf{2}$ |  |  |  |
| Subject | Grade | Target | Actual | Target | Actual | Target | Actual |
|  | 3 | $20-25$ | 20 | $65-70$ | 70 | $5-15$ | 10 |
|  | 4 | $20-25$ | 24 | $65-70$ | 64 | $5-15$ | 12 |
|  | 5 | $20-25$ | 22 | $65-70$ | 63 | $5-15$ | 14 |
| Math | 6 | $10-15$ | 14 | $65-70$ | 70 | $15-25$ | 16 |
|  | 7 | $10-15$ | 14 | $65-70$ | 68 | $15-25$ | 18 |
|  | 8 | $10-15$ | 14 | $65-70$ | 68 | $15-25$ | 18 |
|  | 3 | $20-25$ | 16 | $65-70$ | 68 | $5-15$ | 16 |
|  | 4 | $20-25$ | 18 | $65-70$ | 66 | $5-15$ | 16 |
|  | 5 | $20-25$ | 14 | $65-70$ | 72 | $5-15$ | 14 |
|  | Reading | 6 | $10-15$ | 12 | $65-70$ | 66 | $15-25$ |
|  | 7 | $10-15$ | 10 | $65-70$ | 72 | $15-25$ | 18 |
|  | 8 | $10-15$ | 4 | $65-70$ | 84 | $15-25$ | 12 |
| Science | 5 | $20-25$ | 18 | $65-70$ | 67 | $5-15$ | 16 |
|  | 8 | $10-15$ | 11 | $60-70$ | 69 | $15-30$ | 20 |
| Social | 5 | $20-25$ | 23 | $65-70$ | 67 | $5-15$ | 10 |
|  | 7 | $10-15$ | 11 | $65-70$ | 69 | $15-25$ | 20 |
|  | 8 | $10-15$ | 13 | $65-70$ | 67 | $15-25$ | 20 |

Note: All values are in percentages.

## 1.2.c Configuration of Test Forms and Field-Test Design

Table 1-4 provides an overview of the number of operational and field test items for the Spring 2012 OSTP-OCCT 3-8 assessments. The Spring 2012 test is comprised of a single core of operational items on each form. For each of the MC tests, at least $20 \%$ of the operational items were designated as potential anchor items to be used in the equating process (the process for acceptance as an anchor item is detailed in Section 4). For the 17 MC tests, between eight and twelve field-test forms were created. Each field-test form included the operation core and 10 field-test items. These items are embedded in the operational test forms with the intent of building the item bank for future use. Each form of the assessment was spiraled within classrooms to obtain randomly-equivalent samples of examinees for the field test items.

New items are field-tested to build up the item bank for future high-stakes administrations. The overall field test design used by Pearson was an embedded field test design where newlydeveloped field test items were embedded throughout the test. The advantage of an embedded field test design is that test-takers do not know where the field test items are located and therefore will treat each item as a scored item. Ten multiple choice field test items were placed in common positions on each forms of each assessment. Field test items
were prioritized for inclusion on forms based on current item bank analyses which revealed which particular standards and objectives would benefit most from field testing. The tables in Appendix A contain the counts of field-test items aligned with each PASS objective. Additional Common Core-aligned and vertical linking field test items for Mathematics and Reading are not included in the counts in this table.

Table 1-4. Configuration of the OSTP-OCCT 3-8 Tests for Spring 2012

| Subject | Grade | Counts Across Forms |  |  |  |  | Count of PASS-Aligned Items per FT Form |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Core Forms | FT Forms | OP Items | FT Items* | Total Items | OP | FT* | Total |
| Math | 3 | 1 | 10 | 50 | 40 | 90 | 50 | 5 | 55 |
|  | 4 | 1 | 12 | 50 | 40 | 90 | 50 | 5 | 55 |
|  | 5 | 1 | 12 | 49^ | 40 | 89 | 49^ | 5 | 54 |
|  | 6 | 1 | 12 | 50 | 40 | 90 | 50 | 5 | 55 |
|  | 7 | 1 | 12 | 50 | 40 | 90 | 50 | 5 | 55 |
|  | 8 | 1 | 10 | 50 | 40 | 90 | 50 | 5 | 55 |
| Reading | 3 | 1 | 10 | 50 | 40 | 90 | 50 | 5 | 55 |
|  | 4 | 1 | 12 | 50 | 40 | 90 | 50 | 5 | 55 |
|  | 5 | 1 | 12 | 50 | 40 | 90 | 50 | 5 | 55 |
|  | 6 | 1 | 12 | 50 | 40 | 90 | 50 | 5 | 55 |
|  | 7 | 1 | 12 | 50 | 40 | 90 | 50 | 5 | 55 |
|  | 8 | 1 | 10 | 50 | 40 | 90 | 50 | 5 | 55 |
| Science | 5 | 1 | 12 | 45 | 80 | 125 | 45 | 10 | 55 |
|  | 8 | 1 | 8 | 45 | 80 | 125 | 45 | 10 | 55 |
| Social Studies | 5 | 1 | 12 | 60 | 80 | 140 | 60 | 10 | 70 |
|  | 7 | 1 | 8 | 45 | 80 | 125 | 45 | 10 | 55 |
|  | 8 | 1 | 8 | 45 | 80 | 125 | 45 | 10 | 55 |

Note: OP = Operational; FT = Field Test; *Common Core-aligned Field Test items and Vertical Linking items were administered in Math and Reading and do not contribute to these counts; ^One Math Grade 5 item initially defined as Operational was not scored.

## Section 2

## Administration of the OCCT in Grades 3 to 8

Valid and reliable assessment requires that tests are first constructed in alignment with the Oklahoma content standards and then administered and scored according to sound measurement principles. Sound assessment practices require that schools administer all assessments in a consistent manner across the state so that all students have a fair and equitable opportunity to receive a score that accurately reflects their achievement in each subject. The schools play a key role in administering the OSTP-OCCT 3-8 assessments in a manner consistent with established procedures, monitoring the fair administration of the assessment, and working with the SDE office to address deviations from established assessment administration procedures. The role that district and school faculty members play is essential in the fair and equitable administration of the OCCT.

### 2.1 Packaging and Shipping

To provide OSTP-OCCT 3-8 with secure and dependable services for the shipping of the Oklahoma assessment materials, Pearson's Warehousing and Transportation Department maintains the quality and security of material distribution and return by using such methods as sealed trailers and hiring reputable carriers with the ability to immediately trace shipments. Pearson uses all available tracking capabilities to provide status information and early opportunities for corrective action.

Materials are packaged by school and delivered to the district coordinators. Each shipment to a district contains a shipping document set that includes a packing list for each school's materials and a pallet map that shows the identity and pallet assignment of each carton.

Materials are packaged using information provided by the Assessment Coordinators through the PearsonAccess ${ }^{\text {TN }}$ website, and optionally with data received directly from Oklahoma. Oklahoma educators also use the PearsonAccess ${ }^{\text {TM }}$ site to provide Pearson with the PreIdentification information needed to print the student identification section on answer documents. Bar-coding of all secure materials during the pre-packaging effort allows for accurate tracking of these materials through the entire packing, delivery, and return process. It also permits Pearson to inventory all materials throughout the packaging and delivery process, along with the ability to provide the customer with status updates at any time. Use of handheld radio-frequency scanners in the packaging process help to eliminate the possibility of packing the wrong materials. The proprietary "pick-and-pack" process prompts packaging personnel as to what materials are to go in which shipping box. If the packer tries to pack the wrong item (or number of items into a shipping carton), the system signals an alert.

### 2.2 Materials Return

Test administration handbooks provide clear instructions on how to assemble, box, label, and return testing materials after test administration. Because of the criticality of used test materials and quantities often involved, safety is also a major concern, not only for the materials but for the people moving them. Only single-column boxes are used to distribute and collect test materials, so the weight of each carton is kept to a reasonable and manageable limit.

Paper bands are provided to group and secure used student response booklets for scoring. Color-coded return mailing labels with detailed return information (district address and code number, receipt address, box $x$ of $y$, shipper's tracking number, etc.) are also provided. These labels facilitate accurate and efficient sorting of each carton and its contents upon receipt by Pearson.

### 2.3 Materials Discrepancies Process

The image scanning process enables Pearson to concurrently capture optical mark read (OMR) responses, images, and security information electronically. All scorable material discrepancies are captured, investigated by our Oklahoma Call Center team, reported, and resolved prior to a batch passing through a clean post edit and images being released for scoring.

As scanning of materials progresses, any discrepancies in materials received versus shipped are reported immediately to the SDE, and scoring will begin on materials with no discrepancies. This system allows Pearson to proceed in scoring clean batches while any discrepant material issues are being resolved. As discrepant materials are received, they are processed. Data from discrepant material receipts are captured in the same database as all other material receipts, resulting in a complete record of materials for each school. As batches clear the clean post edit, clipped images are prepared and distributed for scoring. The Oklahoma Call Center Team notifies the SDE regarding unresolved material discrepancies within 24 hours of Pearson's initial attempt to contact the school principal. Within one week after materials are returned, Pearson's Service Center Team also notifies the SDE of any missing or incomplete shipments from schools that received testing materials.

Pearson provides updates to the initial discrepancy reports on a daily basis in response to SDE specifications and requests. The Oklahoma Call Center team makes every attempt to resolve all discrepancies involving secure test books and used answer booklets in a timely manner. Using daily, updated discrepancy reports, Pearson is in constant contact with the respective districts/schools. Pearson and the SDE work out details on specific approaches to resolution of material return discrepancies, and what steps will be taken if unaccounted for secure test books and/or used answer documents are not found and remain unreturned to Pearson.

### 2.4 Processing Assessment Materials Returned by Schools

Pearson's receipt system provides for the logging of materials within 24 hours of receipt and the readiness of materials for scanning within 72 hours of receipt. District status is available from a web-based system accessible to SDE. In addition, the Oklahoma Call Center is able to provide receipt status information as required. The receipt notification website's database is updated daily to allow for accurate information being presented to inquiring district/school personnel. As with initial shipping, the secure and accurate receipt of test materials is a priority with Pearson. Quality assurance procedures provide that all materials are checked in using pre-defined procedures. Materials are handled in a highly secure manner from the time of receipt until final storage and shredding. The receipt of all secure materials is verified through the scanning of barcodes and the comparison of these data to that in security files established during the initial shipment of Oklahoma test materials to the district assessment coordinators.

## Section 3

## Classical Item Analysis and Results

This section provides an overview of the initial statistical analyses carried out for the 2012 administration of the OCCT. Following the administration of the OCCT, student demographic and item response data were transmitted to Pearson research scientists, who are responsible for all statistical analyses for the OCCT assessments. The classical analyses described in this section (as well the calibration and equating of each test) were conducted using carefully selected samples of approximately 15,000 students for each grade and subject.

### 3.1 Data Receipt Activities

After all tests were scored, a data clean-up process that removed invalid cases, ineligible responses, and absent students was preformed for each test. Additionally, a statistical key check was performed at this time. This 'cleaned’ sample was used to create the subsample file to be used in subsequent classical item analyses, calibration, and equating. Upon receipt of data, a Pearson research scientist inspected several data fields to determine if the data met expectations. This included screening the following variables:

- Student ID
- Demographic fields
- Form identification fields
- Raw item responses
- Scored item responses
- Total score and subscore fields
- Fields used to implement exclusion from analysis rules

Exclusion Rules. Following data inspection and clean-up, exclusionary rules were applied to form the final sample that was used for classical item analyses, calibration, and equating. Any student who had attempted at least five responses was eligible for inclusion in the data analyses.

Subsampling. Contractual requirements dictate that equated scale scores and performance levels be delivered to SDE within 48 hours of the close of the testing window for online tests and within 2 weeks of the close of paper-and-pencil tests. To meet this reporting schedule, student data were obtained prior to the close of the administration windows. To ensure that subsamples used for analyses and equating were representative of the population of Oklahoma students, Pearson research scientists pulled stratified subsamples of approximately 15,000 students for each grade and subject, conditioning on district representation, gender, and ethnicity. The sampling technique employed was approved by both the SDE and the Oklahoma Technical Advisory Committee (TAC), a panel of recognized experts in measurement and policy. The demographic breakdown of the students in Spring 2012 item analysis and calibration subsamples appears in Table 3-1 and for all students in Table 3-2. The subsamples used for analyses and equating were deemed to be appropriately representative of the test-taking population.

Statistical Key Check. Administering items that have only one key and are correctly scored is critical for accurate assessment of student performance. To screen for potentially problematic items, a statistical key check was conducted and items were flagged that met any of the following criteria:

- Less than 200 students responded to the item
- Correct response $p$-value less than 0.25
- Correct response uncorrected point-biserial correlation less than 0.20
- Distractor $p$-value greater than or equal to 0.40
- Distractor point-biserial correlation greater than or equal to 0.05

Any flagged operational items are submitted for key review by a Pearson content specialist. Any flagged items that are identified by content experts as having key issues are submitted to SDE for review before dropping the item from the operational scoring. There were no items identified in the Spring 2012 administrations as having a key issue. Once the keys were verified, classical item analyses were conducted.

### 3.2 Classical Item Analyses

Following completion of the data receipt activities and statistical key check, the following classical item analyses were conducted for operational and field test items:

- Percentage of students endorsing each multiple choice response option (overall and broken down by gender and ethnicity)
- Overall p-value for each item
- Point-biserial correlation (overall and broken down by gender and ethnicity)
- Point-biserial for distractor response options (overall and broken down by gender and ethnicity)
- Omit percentage per item
- Mean score by response option (overall and broken down by gender and ethnicity)

The classical analysis of operational items is used as an additional quality control step to ensure that operational items are not behaving in an unexpected or aberrant manner. The item analysis results of the operational items are reviewed by Pearson research scientists and, in the case of unexpected item performance, a course of action (e.g., retain item, drop from operational scoring) regarding the item(s) are recommended to SDE. In the 2012 administration, all operational items preformed adequately and were deemed appropriate for calibration and equating.

## 3.2.a Test-Level Summaries of Classical Item Analyses

The test-level raw score descriptive statistics for the calibration samples are shown in Table 3-3. The operational test results indicate that the omit rates were small for all assessments (grade 3, which is administered using a consumable booklet, is slightly higher). Across tests, the average $p$-value ranged from 0.60 to 0.77 and the average point biserial correlation ranged from 0.36 to 0.42 . In tandem, these summary statistics indicate sets of operational items that are functioning appropriately.

Table 3-3. Test-Level Summaries of Classical Item Analyses for Spring 2012

| Subject | Grade | Sample Size | Mean | Mean $\%$ of Max | Items Points | Mean P | Mean <br> $\mathrm{r}_{\mathrm{pb}}$ | Omit Min | Omit Max |

$r_{\mathrm{pb}}=$ point biserial correlation.

### 3.3 Procedures for Detecting Item Bias

One of the goals of the OSTP-OCCT 3-8 assessments is to assemble a set of items that provides a measure of a student's achievement that is as fair and accurate as possible for all subgroups within the population. Differential item functioning (DIF) analysis refers to statistical procedures that assess whether items are differentially difficult for matched-achievement students across groups. DIF procedures typically control for overall between-group differences on a criterion, usually total test scores. Between-group performance on each item is then compared within sets of examinees having the same total test scores. If the item is differentially more difficult for an identifiable subgroup when conditioned on achievement, the item may be measuring something different from the intended construct. However, it is important to recognize that DIF-flagged items might be related to actual differences in relevant knowledge or skills or statistical Type I error. As a result, DIF statistics are used only to identify potential sources of item bias. Subsequent review by content experts and bias committees are required to determine the source and meaning of performance differences. For the OCCT DIF analyses, DIF statistics were estimated for all major subgroups of students with sufficient sample size: African American, Hispanic, Asian, Native American, and Female.

Field test items with statistically-significant differences in performance were flagged so that items could be carefully examined for possible biased or unfair content that was undetected in earlier fairness and bias content review meetings held prior to form construction.

Pearson used the Mantel-Haenszel (MH) chi-square approach for detecting DIF. Pearson calculated the Mantel-Haenszel statistic (MH D-DIF; Holland \& Thayer 1988) to measure the degree and magnitude of DIF. The student group of interest is the focal group, and the group to which performance on the item is being compared is the reference group. The reference groups for these DIF analyses were white students for race/ethnicity comparisons and male students for gender comparisons. The focal groups were members of minority racial groups and female students.

Items were separated into one of three categories on the basis of DIF statistics (Holland and Thayer 1988; Dorans and Holland 1993): negligible DIF (category A), intermediate DIF (category B), and large DIF (category C). The items in category C, which exhibit significant DIF, are of primary concern. The item classifications are based on the Mantel-Haenszel chisquare and the MH delta $(\Delta)$ value. Positive values of delta indicate that the item is easier for the focal group, and a negative value of delta indicates that the item is more difficult for the focal group. The item classifications are made as follows (Michaelides, 2008):

- The item is classified into the C category if MH D-DIF is significantly different from zero ( $p<0.05$ ), and its absolute value is greater than or equal to 1.5 .
- The item is classified into the B category if MH D-DIF is significantly different from zero ( $p<0.05$ ), and its absolute value is between 1.0 and 1.5 .
- The item is classified into the A category if MH D-DIF is not significantly different from zero ( $p \geq 0.05$ ), or if its absolute value is less than 1.0.

The data in Table 3-4 summarize the number of field test items in DIF categories for the 17 multiple choice tests for the OCCT Spring 2012 administrations. Items flagged for DIF were placed before content experts during the Spring 2012 field test data review (described in Section 3.4.), and items that were determined to exhibit bias as a result of the content of the item were removed from the item bank, excluding them from future use.

Table 3-4. DIF Flag Incidence Across All OSTP-OCCT 3-8 Field Test Items for Spring 2012

### 3.4 Data Review

Data review represents a critical step in the test development cycle. At the data review meeting, SDE and Pearson staff had the opportunity to review actual student performance on the newly-developed, field-tested multiple choice items across the 17 subjects and grades based on the Spring 2012 administration. The data review focused on the content validity, curricular alignment, and statistical functioning of field-tested items prior to selection for operational test forms. The field test results used in the data review provided evidence that the items were designed to yield valid results and were accessible for use by the widest possible range of students. The review of student performance should provide evidence regarding the fulfillment of requirement 200.2(b)(2)of NCLB. The purpose of the review meeting was to ensure that psychometrically-sound, fair, and aligned items are used in the construction of the OCCT 3-8 assessments and entered into the respective item banks. Pearson provided content and psychometric expertise to provide a clear explanation about the content of the items, the field test process, the scoring process, and the resulting field test data to ensure the success of these meetings and the defensibility of the program.

## 3.4.a Data Review Materials and Meetings

Data review meetings were undertaken as a collaborative effort between SDE and Pearson. SDE administrators and content specialists attended the meeting facilitated by Pearson content specialists and research scientists who trained the SDE staff on how to interpret and review the field test data. Meeting materials included a document explaining the flagging criteria and a binder containing item images and statistics. Pearson discussed with SDE the analyses performed and the criteria for flagging items. Flagged items were then reviewed and decisions were made on an item-by-item basis as to whether to accept the item, accept the item with revisions (which would require re-field-testing prior to operational use), or reject the item. Review of the data included presentation of the item's $p$-value, point-biserial correlation, point-biserial correlation by response option, response distributions, mean overall score by response option, frequency distributions of response options by students in the lower, middle, and upper third of the score distribution, and indications of item DIF and IRT misfit. Items failing to meet the minimum performance requirements as set by the flagging criteria were carefully considered for rejection by the review panel, thereby enhancing the reliability and improving the validity of the items left in the bank for future use. While the panel used the data as a tool to inform their judgments, the panel (and not the data alone) made the final determination as to the appropriateness or fairness of the assessment items. The flagging criteria for the OCCT assessments are as follows:

- p-value < 25 or > . 90
- point-biserial correlation < . 20
- distractor point-biserial correlation > . 05
- differential item functioning (DIF): test item biases for subgroups
- IRT misfit as flagged by the $Q_{1}$ index (see Section 4.2)

Bias Review. One key goal of the data review meetings was to assess potential bias based on DIF results and item content. Although efforts were made to mitigate potential item bias through rigorous writer training and review processes, there remains potential for bias to be present in items, which may be detected through statistical analysis. It is important to include this step in the development cycle, because SDE and Pearson wish to avoid inclusion of an item that is biased in some way against a group, which may lead to inequitable test results. As described earlier, all field test items were analyzed statistically for DIF using the field test data. A Pearson research scientist explained the meaning, in terms of level, and the direction of the DIF flags. The data review panel reviewed the item content, the percentage of students selecting each response option, and the point-biserial correlation for each response option by subgroup for all items flagged for DIF. The data review panel was then asked if there was evidence of context (e.g., cultural barriers) or language in an item that might result in bias. The data review panel made the final determination regarding the presence of item bias.

## 3.4.b Results of Data Review

The number of items inspected during data review as a result of employing the previouslydescribed flagging criteria for the classical item analyses, DIF, and IRT procedures is presented in Table 3-5.

Table 3-5. Spring 2012 Data Review Flagging and Outcomes Summary

| Subject | Grade | FT Items | No. <br> Flagged | Rejected | Accepted | Accepted <br> with <br> Edits |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Math | 3 | 40 | 19 | 5 | 31 | 4 |
|  | 4 | 40 | 13 | 2 | 36 | 2 |
|  | 5 | 40 | 13 | 1 | 34 | 5 |
|  | 6 | 40 | 12 | 0 | 36 | 4 |
|  | 7 | 40 | 14 | 1 | 32 | 7 |
|  | 8 | 40 | 15 | 2 | 37 | 1 |
|  | 3 | 40 | 16 | 1 | 39 | 0 |
|  | 4 | 40 | 9 | 4 | 36 | 0 |
|  | 5 | 40 | 12 | 5 | 35 | 0 |
|  | 6 | 40 | 13 | 6 | 34 | 0 |
| Reading | 7 | 40 | 18 | 9 | 31 | 0 |
|  | 8 | 40 | 20 | 6 | 34 | 0 |
| Science | 5 | 80 | 19 | 4 | 69 | 7 |
|  | 8 | 80 | 29 | 9 | 68 | 3 |
| Social | 5 | 80 | 37 | 19 | 53 | 8 |
|  | 7 | 80 | 39 | 22 | 52 | 6 |
|  | 8 | 80 | 18 | 10 | 70 | 0 |

*Note. A large number of adequately-performing Social Studies items were rejected at data review due to a recent curriculum change, which resulted in these items no longer aligning to the content standards set to go into effect in 2012-13.

### 3.5 Test Reliability

The reliability of a test provides an estimate of the extent to which an assessment will yield the similar results when administered in different times, locations, or samples, when the two administrations do not differ in relevant variables. The reliability coefficient is an index of consistency of test results. Reliability coefficients are usually forms of correlation coefficients and must be interpreted within the context and design of the assessment and of the reliability study. Cronbach's alpha is a commonly-used internal consistency measure, which is derived from analysis of the consistency of the performance of individuals on items in a test administration. Cronbach's alpha is calculated as shown in equation (1). In this formula, $s_{i}{ }^{2}$ denotes the estimated variance for each item, with items indexed $i=1,2, \ldots, k$, and $s^{2}{ }_{\text {sum }}$ denotes the variance for the sum of all $k$ items:

$$
\begin{equation*}
\alpha=\left(\frac{k}{k-1}\right)\left(1-\frac{\sum_{i=1}^{k} s_{i}^{2}}{s_{\text {sum }}^{2}}\right) . \tag{1}
\end{equation*}
$$

Cronbach's alpha was estimated for each of the content areas for the operational portion of the test.

Table 3-6 presents Cronbach's alpha for the operational tests by subject area for the Spring 2012 OCCT administration. These reliability coefficients indicate that the OSTP-OCCT assessments had strong internal consistency and that the tests produce relatively stable scores. Additionally, Table 3-6 shows the reliability analysis results by the different reporting subgroups for the OSTP-OCCT assessments for Spring 2012 for the operational items. In all instances, the reliability coefficients are well above the accepted lower limit of .70, with most values near . 90 .

Table 3-6. Test Reliability by Subgroup for Spring 2012

| Subject | Grade | All | F | M | AA | NA | HI | AS | PI | WH | OT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note. Missing values in this table are reflective of subgroups with insufficient score variability for computation of reliability coefficients; $F=$ Female, $M=$ Male, $A A=$ African American, $N A=$ Native American, $\mathrm{HI}=\mathrm{Hispanic}, \mathrm{AS}=$ Asian, PI = Pacific Islander, WH = White, $\mathrm{O}=$ Other.

### 3.6 Analysis of the Writing Tests

The administration of the Spring 2012 Writing assessment took place on February 21 and 22, 2012. Students in grades 5 and 8 responded to one operational writing prompt. The following sections describe the statistical analyses conducted to place the 2012 operational writing prompts on the scale established in 2006.

## 3.6.a Prompt Scoring

The writing score is a weighted composite of five analytic scores that focus on specific domains of writing skills. These skills are listed in Table 3-7. Each student's response to a prompt is read by two independent raters; the raters' scores for each domain are averaged. The domain scores range from 1 (the lowest score) to 4 (the highest score).

Table 3-7. Writing Analytic Traits and Scoring Weights

| Writing Analytic Traits | Weight |
| :--- | :---: |
| Ideas and Development (ID) | $30 \%$ |
| Organization, Unity, and Coherence (OUC) | $25 \%$ |
| Word Choice (WC) | $15 \%$ |
| Sentences and Paragraphs (SP) | $15 \%$ |
| Grammar, Usage, and Mechanics (GUM) | $15 \%$ |

The raw composite score ( RCS ) is calculated as a weighted composite of the average of two independent ratings for each of the five analytic traits:

$$
\begin{equation*}
R C S=15 *(0.30 * I D+0.25 * \mathrm{OUC}+0.15 * \mathrm{WC}+0.15 * \mathrm{SP}+0.15 * \mathrm{GUM}) \tag{2}
\end{equation*}
$$

## 3.6.b Adjustment for Rater-Year Effects

The baseline for each grade's operational writing scale was 2006. To place the 2012 operational prompt scores on the 2006 scale, transformation constants were obtained to adjust RCS scores for prompt difficulty and for rater-year effects relative to a target distribution. All calculations were performed on the RCS prior to rounding. For reporting, the scaled composite scores (SCS) were then rounded to the nearest integer between 15 and 60. For each of the writing prompts field-tested in 2007, ETS provided a set of unique transformation constants to adjust for prompt difficulty. Based on ETS' report, OCCT Writing: Scaling the 2007 Field-Test Prompts (ETS, 2007), the following equation was used to adjust the 2012 raw composite scores:

$$
\begin{equation*}
S C S_{12}=B_{07}\left(R C S_{12}\right)+A_{07} \tag{3}
\end{equation*}
$$

Where $\mathrm{SCS}_{12}$ represents the scaled composite score after adjusting the 2012 prompt to the 2007 scale.

In 2012, Pearson also performed a rater drift study to adjust for the difference in raters between the 2007 administration to the current administration. Pearson's Performance Scoring Center (PSC) blindly rescored approximately 500 randomly-selected student responses from 2007 for each grade's prompt. Only prompts with valid scored responses (i.e., no condition codes such as off-topic) from 2007 were selected to be rescored in 2012 as part of the rater drift study. The rescored prompts were then linked to their original 2007 scores and formed the basis for computation of a second set of linear scaling constants.

The 2012 rater effect constants $\left(C_{12} \& D_{12}\right)$ were determined by using the means $(M)$ and standard deviations $(\mathrm{S})$ of the 2007 raw composite scores and the 2012 rescored raw composite scores as calculated below for each grade.

$$
\begin{gather*}
D_{12}=S_{07} / S_{12}  \tag{4}\\
C_{12}=M_{07}-\left(M_{12} * D_{12}\right) \tag{5}
\end{gather*}
$$

Because both are corrected due to raters and a rescaling to the 2007 scale is desired, a compound adjustment-using both sets of constants-is required. Final scaled composite scores where computed using the formula below:

$$
\begin{equation*}
S C S_{12}=B_{07}\left[\left(D_{12} * R C S_{12}\right)+C_{12}\right]+A_{07} \tag{6}
\end{equation*}
$$

Table 3-8 provides the resulting score distribution statistics after performing the described compound adjustment. Final 2012 transformation constants are also provided within this table.

Table 3-8. Results of Grades 5 and 8 Writing Prompt Scoring and Scaling

| Grade | Statistic | 2012 | 2011 | 2010 | 2009 |
| :---: | :---: | :---: | :---: | :---: | :---: |

|  | C | -1.7106 |  |  |  |
|  | D | 1.1107 |  |  |  |

## 3.6.c Inter-rater Reliability

Inter-rater reliability is referred to as the degree of agreement among scorers that allows for the scores to be interpreted as reasonably intended by the test developer (AERA, APA and NCME, 1999). Raters for the grades 5 and 8 Writing assessments were trained to implement the scoring rubrics, anchor papers, check sets, and resolution reading. The items were analytically scored by two raters on five traits in both grades. The final writing score for a student in a given trait is the average of the two scores. The inter-rater reliability coefficients for the operational prompt are presented in Table 3-9. The results show that
exact and adjacent rater agreement on trait scores for both the grades 5 and 8 operational writing prompts were reasonably high. The weighted Kappa statistic (Kraemer, 1982) is an indication of inter-rater reliability after correcting for chance. The Kappa values for the OCCT grades 5 and 8 Writing assessments' writing prompts fall within the moderate range.

Table 3-9. Inter-rater Reliability for Grades 5 and 8 Writing Prompts for Spring 2012

| Trait | Max Points | Valid <br> N | Point Discrepancy Percentages |  |  |  |  |  |  | Agreement Percentages |  |  | Kappa |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | -3 | -2 | -1 | 0 | 1 | 2 | 3 | Exact | Adjacent | +1-2 or |  |
| Grade 5 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 1 | 4 | 45,427 | 0.00 | 0.56 | 18.02 | 62.82 | 18.06 | 0.53 | 0.01 | 62.82 | 36.08 | 1.10 | 0.44 |
| 2 | 4 | 45,427 | 0.01 | 0.70 | 18.43 | 61.58 | 18.70 | 0.59 | 0.00 | 61.58 | 37.13 | 1.30 | 0.42 |
| 3 | 4 | 45,427 | 0.00 | 0.66 | 18.42 | 61.81 | 18.53 | 0.56 | 0.00 | 61.81 | 36.95 | 1.22 | 0.43 |
| 4 | 4 | 45,427 | 0.00 | 0.76 | 18.99 | 60.24 | 19.30 | 0.71 | 0.00 | 60.24 | 38.29 | 1.47 | 0.43 |
| 5 | 4 | 45,427 | 0.01 | 0.78 | 18.91 | 60.34 | 19.14 | 0.83 | 0.00 | 60.34 | 38.05 | 1.62 | 0.44 |
| Grade 8 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 1 | 4 | 44,720 | 0.01 | 0.42 | 16.76 | 65.56 | 16.82 | 0.42 | 0.00 | 65.56 | 33.58 | 0.85 | 0.40 |
| 2 | 4 | 44,720 | 0.01 | 0.62 | 17.44 | 63.71 | 17.62 | 0.59 | 0.00 | 63.71 | 35.06 | 1.22 | 0.43 |

| 5 | 4 | 44,720 | 0.01 | 0.68 | 19.02 | 60.72 | 18.89 | 0.68 | 0.00 | 60.72 | 37.91 | 1.37 | 0.40 |

## Section 4

## Calibration, Equating, and Scaling

### 4.1 Item Response Theory (IRT) Models

Dichotomous Item Response Theory Model. The three-parameter logistic (3-PL) item response theory (IRT) model (Lord \& Novick, 1968) was used for calibrating the dichotomously-scored multiple choice items. In the 3-PL model (Lord, 1980), the probability that a student with an achievement level of $\theta$ responds correctly to item $i$ is

$$
\begin{equation*}
P_{i}(\theta)=c_{i}+\left(1-c_{i}\right) \frac{1}{1+e^{-D a_{i}\left(\theta-b_{i}\right)}}, \tag{7}
\end{equation*}
$$

where $a_{i}$ is the item discrimination parameter, $b_{i}$ is the item difficulty parameter, $c_{i}$ is the lower asymptote parameter, and $D$ is a scaling constant, which is traditionally equal to 1.7. With multiple-choice items it is assumed that, due to guessing, examinees with very low achievement levels have a non-zero probability of responding correctly to an item. This probability is represented in the $3-\mathrm{PL}$ model by the $c_{i}$ parameter.

IRT models were fit to the 2012 assessment data using MULTILOG version 7.03 (Thissen, Chen, \& Bock, 2003). MULTILOG estimates parameters simultaneously for dichotomous items via marginal maximum likelihood. All item and calibrations and scoring were independently conducted and verified by two Pearson research scientists.

### 4.2 Assessment of Item Fit to the IRT Model

Item fit was assessed using Yen's $(1981,1984) Q_{1}$ item fit index, which approximately follows a $\chi^{2}$ distribution:

$$
\begin{equation*}
Q_{1 i}=\sum_{r=1}^{10} \frac{N_{r}\left(O_{i r}-E_{i r}\right)^{2}}{E_{i r}\left(1-E_{i r}\right)}, \tag{8}
\end{equation*}
$$

where $Q_{1 i}$ is the fit of item $i, N_{r}$ is the number of examinees per cell, $O_{i r}$ is the observed proportion of examinees in cell $r$ that correctly answered item $i$, and $E_{i r}$ is the expected portion of examinees in cell $r$ that correctly answered item $i$. The expected proportions are computed using achievement- and item parameter estimates in Equation (7) and summing over examinees in cell $r$ :

$$
\begin{equation*}
E_{i r}=\frac{1}{N_{i r}} \sum_{k g r}^{N_{i r}} P_{i}\left(\hat{\theta}_{k}\right) . \tag{9}
\end{equation*}
$$

Because chi-square statistics are affected by sample size and associated degrees of freedom, the following standardization of the $Q_{1}$ statistic was used:

$$
\begin{equation*}
Z_{j}=\frac{Q_{1 i}-d f}{\sqrt{(2 d f)}} \tag{10}
\end{equation*}
$$

The Z-statistic is an index of the degree to which observed proportions of item scores are similar to the proportions that would be expected, given the estimated ability- and item parameters. Large differences between expected and observed item performance may indicate poor item fit. To assess item fit, a critical Z-value is determined. Items with Z-values that are larger than this critical $Z$-value have poor item fit. The item characteristic curves, classical item statistics, and item content were reviewed for items flagged by $Q_{1}$. An internally-developed software program, Q1Static, was used to compute the $Q_{1}$ item fit index.

Operational items flagged by $Q_{1}$ that were not flagged by the classical item statistics and had reasonable IRT parameter estimates were not reviewed further. If any operational items were also flagged by classical item statistics or had poor IRT parameter estimates (e.g., low a parameter), the items were reviewed by Pearson content specialists. Any item that was potentially mis-keyed was presented to SDE to make a decision regarding whether to keep or remove the item. A total of seven operational items (three in grade 3 Reading, and one each in grade 4 Mathematics, grade 8 Reading, grade 7 Geography, and grade 8 Science) were flagged as potentially misfitting, but showed no other evidence of aberrant behavior, and were not sent for further review.

Field Test Items. The field test items across all subjects were evaluated using the $Q_{1}$ statistic to evaluate the extent to which the obtained proportions of item scores are close to the proportions that would be expected based on the estimated thetas and item parameters. Any field test items flagged by $Q_{1}$ were included in the data review for review by contest specialists from Pearson and SDE (for more information on data review, see Section 3.4).

### 4.3 Calibration and Equating

The 3-PL model was used for calibration of all multiple choice items. A common item, nonequivalent groups (CINEG) design was used for all content areas to link the current test forms the base scale. Typically, for the CINEG design, common (anchor) items are selected to be representative of the test content in terms of difficulty and the test blueprint. The Stocking and Lord (1983) procedure, which estimates the equating transformation constants by minimizing the distance between the test characteristic curves of the common items, was used to equate the tests to the base year. Equating was conducted using freely-available software, STUIRT (Kim \& Kolen, 2004). Prior to conducting the equating, anchor item stability checks were performed to eliminate the impact of item drift on equating.

### 4.4 Anchor Items and Anchor Stability Evaluation Methods

Table 4-1 presents the number and percentage of anchor items (before and after anchor stability checks) by subject and grade for the Spring 2012 administration. For each test, the anchor set was comprised of at least $20 \%$ of all operational items. The anchor set was proportionally representative of the total test in terms of content assessed, and it mimicked the difficulty of the overall test as well.

Table 4-1. Number of Anchor Items per Grade and Subject for Spring 2012

| Subject | Grade | Operational Items | Initial Anchor Set |  | Final Anchor Set |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Items | \% | Item | \% |
| Math | 3 | 50 | 19 | 38\% | 19 | 38\% |
|  | 4 | 50 | 19 | 38\% | 17 | 34\% |
|  | 5 | 49 | 18 | 37\% | 18 | 37\% |
|  | 6 | 50 | 19 | 38\% | 18 | 36\% |
|  | 7 | 50 | 18 | 36\% | 18 | 36\% |
|  | 8 | 50 | 19 | 38\% | 18 | 36\% |
| Reading | 3 | 50 | 20 | 40\% | 17 | 34\% |
|  | 4 | 50 | 20 | 40\% | 20 | 40\% |
|  | 5 | 50 | 22 | 44\% | 22 | 44\% |
|  | 6 | 50 | 23 | 46\% | 23 | 46\% |
|  | 7 | 50 | 20 | 40\% | 16 | 32\% |
|  | 8 | 50 | 19 | 38\% | 19 | 38\% |
| Science | 5 | 45 | 16 | 36\% | 13 | 29\% |
|  | 8 | 45 | 15 | 33\% | 13 | 29\% |
| Social Studies | 5 | 60 | 20 | 33\% | 20 | 33\% |
|  | 7 | 45 | 17 | 38\% | 15 | 33\% |
|  | 8 | 45 | 17 | 38\% | 15 | 33\% |

Despite the careful selection and placement of anchor items, it is possible for these items to perform differentially across administrations. Dramatic changes in item parameter values can result in systematic errors in equating results (Kolen \& Brennan, 2004). As a result, prior to finalizing the equating constants, Pearson evaluated changes in the item parameters from the item bank to the Spring 2012 administration. The process used in this evaluation is called an anchor stability check.

The anchor item parameter stability check that Pearson performed is an iterative approach, which uses a method that is similar to the one used to check for differential item functioning. This method is called the $d^{2}$ procedure. The steps taken were as follows:

1) Use a theoretically-weighted posterior $\theta$ distribution, $g\left(\theta_{k}\right)$, with 40 quadrature points.
2) Place the current anchor item parameters on the baseline scale by computing Stocking \& Lord (SL) constants using STUIRT and all (k) anchor items.
3) Apply the SL anchor constants to the current item parameters, and compute the current raw score to scale score table. The results based on all $k$ anchor items comprise the original table.
4) For each item, calculate the weighted sum of the squared deviation $\left(d^{2}\right)$ between the two item characteristic curves-one ICC computed from each set of parameters.
a) For each item, calculate a weighted sum of the squared deviation between the ICCs based on old ( x ) and new ( y ) parameters at each point on this theta distribution.

$$
\begin{equation*}
d_{i}^{2}=\sum^{k}\left[P_{i x}\left(\theta_{k}\right)-P_{i y}\left(\theta_{k}\right)\right]^{2} \bullet g\left(\theta_{k}\right) \tag{11}
\end{equation*}
$$

b) Review and sort the items in a descending (largest to smallest) fashion according to the $d^{2}$ estimate.
c) Drop the items with the largest $d^{2}$ item from inclusion in the anchor set.
5) Repeat steps 2 through 4, dropping one item for each iteration, until 10 items are dropped. This will result in 11 raw score to scale score tables.
6) Compare each RSSS table with the RSSS based on the use of one less anchor item. When two adjacent RSSS tables no longer differ in performance classification at each of the raw cut score points, the anchor set is considered stable. The constants used to generate the RSSS based on the largest number of anchor items when stability is achieved are retained as the final SL constants.

Before removing any item from the item parameter stability check, the following additional characteristics were examined: 1) prior and current year $p$-values and point-biserial correlations, 2) prior and current year IRT parameter estimates, 3) prior and current year item sequence, 4) standard and objective/skill of the item, 5) impact on blueprint representation, 6) passage ID/title for items linked to a stimulus, and 7) content review of the actual item. Decisions about whether to keep or remove an item were evaluated on a per item basis, and only one item was removed at a time.

Once the anchor set was finalized, the equating constants obtained from the final Stocking and Lord (1983) run were applied to the non-anchor operational items for computation of raw score to scale score tables. Table 4-1 shows the final number of anchor items used for equating each test. Any item removed from the anchor set during the parameter stability check set still contributed to student scores.

### 4.5 Scaling and Scoring Results

The lowest obtainable scale score (LOSS), highest obtainable scale score (HOSS), and final scaling constants for each of the subjects are shown in Table 4-2. The scaling constants, M1 (multiplicative) and M2 (additive), place the true scores associated with each raw score point onto the reporting (or operational) scale using a straightforward linear transformation:

$$
\begin{equation*}
\text { Scale Score }=(\hat{\tau} \times M 1)+M 2 \tag{12}
\end{equation*}
$$

where, $\hat{\tau}=$ estimated true score.
The true-score equivalent corresponding to each raw score was estimated from equated parameter estimates using a freely-available software program, POLYEQUATE (Kolen, 2004). Each scale score on the assessment is associated with a performance level that describes the types of behavior, knowledge, and skill a student in this score level is expected to demonstrate. For the OCCT 3-8 assessments, there are three cut scores that divide scores into four performance levels: Unsatisfactory, Limited Knowledge, Proficient, and Advanced. The cut scores for each of the tests appear in Table 4-2. In addition, a conditional standard error of measurement (CSEM; see Section 6.3) was computed for each of the raw score points. The resulting raw score to scale score conversions, CSEMs, and performance levels for Spring 2012 are shown in Table 4-3 to Table 4-8. RSSS tables for grades 5 and 8 Writing are not included in these tables as the there no further transformation of the composite score beyond that described in Section 3.6.

Table 4-2. LOSS, HOSS, Scaling Constants, and Cut Scores by Subject

|  |  |  |  |  | Limited | Proficient | Advanced |  |

## Section 5

## Classification Consistency and Accuracy Studies

### 5.1 Classification Consistency and Accuracy

Every test administration will result in some error in classifying examinees. The concept of the standard error of measurement (SEM) has implications for the interpretation of cut scores used to classify students into different performance levels. For example, a given student may have a true performance level greater than a cut score; however, due to random variations (measurement error), the student's observed test score may be below the cut score. As a result, the student would be classified as having a lower performance level. As discussed in Section 6.4, a student's observed score is most likely to fall within a standard error band around his or her true score. Thus, the classification of students into different performance levels can be imperfect; especially for the borderline students whose true scores lie close to the performance level cut scores.

According to Livingston and Lewis (1995, p. 180), the accuracy of a classification is "the extent to which the actual classifications of the test takers... agree with those that would be made on the basis of their true score" and are calculated from cross-tabulations between "classifications based on an observable variable and classifications based on an unobservable variable." Since the unobservable variable-the true score-is not available, Livingston and Lewis provide a method to estimate the true score distribution of a test and create the crosstabulation of the true score and observed variable (raw score) classifications. Consistency is "the agreement between classifications based on two non-overlapping, equally-difficult forms of the test" (p. 180). Consistency is estimated using actual response data from a test and the test's reliability to statistically model two parallel forms of the test and compare the classifications on those alternate forms. There are three types of accuracy and consistency indices that can be generated using Livingston and Lewis' approach: overall, conditional on level, and by cut score.

The overall accuracy of performance level classifications is computed as a sum of the proportions on the diagonal of the joint distribution of true score and observed score levels. Essentially, overall accuracy is the proportion of correct classifications across all levels. The overall consistency index is computed as the sum of the diagonal cells in a consistency table. Another way to express overall consistency is to use the kappa coefficient, as used in the inter-rater reliability studies in Section 3. Like the inter-rater reliability studies, kappa provides an estimate of agreement or the proportion of consistent classifications between two different tests after taking into account agreement due to chance.

Consistency conditional on performance level is computed as the ratio between the proportion of correct classifications at the selected performance level (for example, proficient students who were classified as proficient) and the proportion of all the students classified into that level (total proportion of students who were considered proficient). Accuracy conditional on performance level is computed in a similar manner, except that in the consistency table where both row and column marginal sums are the same, the accuracy table uses the sum based on estimated status as the total for computing accuracy conditional on performance level.

To evaluate decisions at specific cut scores, the joint distribution of all the performance levels are collapsed into dichotomized distributions around that specific cut score (for example collapsing Unsatisfactory and Limited Knowledge and then Proficient and Advanced to assess decisions at the Proficient cut score). The accuracy index at a cut score is computed as the sum of the proportions of correct classifications around this selected cut score. The consistency at a specific cut score is obtained in a similar way, but by dichotomizing the distributions at the cut score performance level and between all other performance levels combined. Table 5-1 presents the overall accuracy and consistency indices for the Spring 2012 OCCT 3-8 tests.

Table 5-1. Estimates of Accuracy and Consistency in Performance Classifications

| Subject | Grade | Accuracy | Consistency | Kappa <br> $(\mathbf{K})$ | False <br> Positive | False <br> Negative |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Math | 3 | 0.75 | 0.69 | 0.54 | 0.20 | 0.06 |
|  | 4 | 0.77 | 0.71 | 0.54 | 0.08 | 0.14 |
|  | 5 | 0.74 | 0.68 | 0.54 | 0.06 | 0.20 |
|  | 6 | 0.74 | 0.71 | 0.57 | 0.15 | 0.11 |
|  | 7 | 0.78 | 0.71 | 0.55 | 0.12 | 0.10 |
|  | 8 | 0.77 | 0.70 | 0.57 | 0.10 | 0.13 |
| Reading | 3 | 0.87 | 0.81 | 0.61 | 0.06 | 0.08 |
|  | 4 | 0.82 | 0.76 | 0.58 | 0.09 | 0.09 |
|  | 6 | 0.76 | 0.71 | 0.52 | 0.11 | 0.13 |
|  | 7 | 0.79 | 0.74 | 0.55 | 0.07 | 0.14 |
|  | 8 | 0.73 | 0.66 | 0.44 | 0.23 | 0.05 |
| Science | 5 | 0.80 | 0.77 | 0.41 | 0.22 | 0.05 |
|  | 8 | 0.82 | 0.77 | 0.54 | 0.10 | 0.11 |
| Social | 5 | 0.77 | 0.71 | 0.50 | 0.06 | 0.12 |
|  | 7 | 0.80 | 0.73 | 0.53 | 0.06 | 0.17 |
|  | 8 | 0.78 | 0.73 | 0.57 | 0.10 | 0.12 |

As shown in Table 5-1, the overall accuracy indices range between 72 and 87 percent, and overall consistency ranges between 66 and 81 for the Spring 2012 OCCT administration. Kappa coefficients range from 0.41 and 0.61 . The rate of estimated false positives ranges from 6 to 23 and estimated false negative rates range from 5 to 20 percent.

Table 5-2 provides the accuracy, consistency, false positive, and false negative rates by cut score for Spring 2012. The data in these tables reveal that the level of agreement for both accuracy and consistency is above 80 percent in all cases, with most above 90 percent. In general, the high rates of accuracy and consistency support the cut decisions made using these assessments. Similar to Table 5-1, the false positive and false negative rates are quite low.

The importance of the dichotomous categorization is particularly notable when they map onto proficient/not proficient decisions for the assessments. For the OCCT 3-8 tests, the U+L/P +A is the important dichotomization, because it directly translates to the proficient/not proficient decision point, which is important in computing Adequate Yearly Progress (AYP). Similar to other dichotomization distinctions, there are three main scenarios at this cut point: 1) observed performance is accurately reflective of the true ability level (i.e., the examinee is proficient and should have being proficient); 2) the true achievement level is below the standard, but the observed test score is above the standard (i.e., a false positive); and 3) the true achievement level is above the standard, but the observed test score is below the standard (i.e., a false negative). In examining Table 5-2, for example, we estimate that 90 percent of grade 3 Mathematics students were correctly classified as proficient or not proficient based on their performance (scenario 1), 8 percent were considered proficient but their true performance is below the standard (scenario 2 ), and 2 percent were not considered proficient although their true performance is above the standard (scenario 3). Overall, the estimated rates for accurate classification are above $85 \%$ for the administration of all subjects and grades - students are appropriately (more than $85 \%$ of the time) categorized into proficient/not proficient classifications based on their true ability using their observed score (raw score) as their classification score.

Table 5-2. Accuracy and Consistency Estimates and False Positive/False Negative Rates by Cut Score

| Subject | Grade | Accuracy |  |  | Consistency |  |  | False Positive |  |  | False Negative |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note: U =Unsatisfactory; L = Limited Knowledge; P = Proficient; and A = Advanced
Note: U / L+P+A = Unsatisfactory divided by Limited Knowledge plus Proficient plus Advanced; U+L/P+A = Unsatisfactory plus Limited Knowledge divided by Proficient plus Advanced; U+L+P / A = Unsatisfactory plus Limited Knowledge plus Proficient divided by Advanced.

## Section 6

## Summary Statistics

### 6.1 Descriptive Statistics

The summary descriptive statistics of the scale scores for the Spring 2012 test-taking population appears in Table 6-1 through Table 6-4. The scales scores presented exclude invalid student cases.

Table 6-1. Descriptive Statistics of Scale Scores for Spring 2012-Overall

| Subject/Grade |  | Scale Score |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | N | Mean | SD | Median |

Note: $\mathrm{N}=$ Sample size; SD = Standard Deviation; Med. = Median.

### 6.2 Performance Level Distribution

The distributions of students in the four performance levels based on the test-taking population's performance in the Spring 2012 administration are presented in Table 6-5 (also, see Appendix B). The percentage distributions for each of the content areas are comparable to previous administrations (e.g., Spring 2011).

Table 6-5. Percentage of Students by Performance Level for Spring 2012

| Subject/Grade |  | N | Unsatisfactory | Limited Knowledge | Proficient | Advanced |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Math | 3 | 45237 | 10.1\% | 20.0\% | 45.3\% | 24.7\% |
|  | 4 | 43951 | 9.8\% | 17.2\% | 53.2\% | 19.8\% |
|  | 5 | 43478 | 10.4\% | 19.4\% | 42.5\% | 27.8\% |
|  | 6 | 43228 | 15.5\% | 13.7\% | 50.3\% | 20.5\% |
|  | 7 | 41329 | 17.1\% | 12.6\% | 51.6\% | 18.7\% |
|  | 8 | 41015 | 10.8\% | 20.6\% | 42.7\% | 26.0\% |
|  | All | 258238 | 12.2\% | 17.3\% | 47.6\% | 22.9\% |
| Reading | 3 | 44542 | 11.3\% | 16.7\% | 68.9\% | 3.1\% |
|  | 4 | 43183 | 15.1\% | 21.5\% | 59.0\% | 4.5\% |
|  | 5 | 42925 | 10.5\% | 21.8\% | 56.2\% | 11.5\% |
|  | 6 | 43009 | 14.1\% | 17.0\% | 60.2\% | 8.7\% |
|  | 7 | 41541 | 11.7\% | 13.5\% | 55.9\% | 18.9\% |
|  | 8 | 41226 | 8.5\% | 12.1\% | 61.4\% | 18.0\% |
|  | All | 256426 | 11.9\% | 17.1\% | 60.3\% | 10.6\% |
| Science | 5 | 43989 | 2.6\% | 9.2\% | 58.5\% | 29.8\% |
|  | 8 | 42935 | 3.5\% | 9.9\% | 70.0\% | 16.7\% |
|  | All | 86924 | 3.0\% | 9.5\% | 64.2\% | 23.3\% |
| Social Studies | 5 | 47169 | 10.5\% | 20.2\% | 46.4\% | 22.9\% |
|  | 7 | 44890 | 2.7\% | 14.1\% | 58.2\% | 25.0\% |
|  | 8 | 45794 | 8.4\% | 21.6\% | 54.3\% | 15.7\% |
|  | All | 137853 | 7.3\% | 18.7\% | 52.9\% | 21.2\% |

### 6.3 Conditional Standard Error of Measurement

The conditional standard error of measurement (CSEM) was computed for each reported scale score. CSEM was computed using an IRT-based approach based on the following formula:

$$
\begin{equation*}
\operatorname{CSEM}\left(O_{X} \mid \theta\right)=\sqrt{\left[\sum_{X=0}^{\operatorname{MaxX}} O_{X}^{2} p(X \mid \theta)\right]-\left[\sum_{X=0}^{\operatorname{MaxX}} O_{X} \cdot p(X \mid \theta)\right]^{2}} \tag{13}
\end{equation*}
$$

where $O_{\mathrm{x}}$ is the observed scaled score for a particular number-correct score $X, \theta$ is the IRT achievement scale value conditioned on, and $p(\bullet)$ is the probability function. Pearson has implemented a computational approach for estimating $\operatorname{CSEM}\left(O_{\mathrm{x}} \mid \theta\right)$ in which $p(X \mid \theta)$ is computed using a recursive algorithm given by Thissen, Pommerich, Billeaud, and Williams
(1995). This algorithm is a polytomous generalization of the algorithm for dichotomous items given by Lord and Wingersky (1984). The values of $\theta$ used with the algorithm are obtained through the true score equating process (i.e., by solving for $\theta$ through the test characteristic curve for each number-correct score, $X$ ). There is one CSEM per number-correct score. The CSEMs by subject appear in Table 4-3 to Table 4-8 for the Spring 2012 administration of the OCCT.

### 6.4 Standard Error of Measurement

Measurement error is associated with every test score. A student's true score is the hypothetical average score that would result if the student took the test repeatedly under similar conditions. The standard error of measurement (SEM), as an overall test-level measure of error, can be used to construct a range around any given observed test score that likely includes the student's true score. SEM is computed by taking the square root of the average value of the variances of the error of measurement associated with each of the raw score or scales scores:

$$
\begin{equation*}
S E M=\sqrt{\frac{\sum_{j}\left(\text { CSEM }_{j}{ }^{2} \cdot N_{j}\right)}{N_{T}}} \tag{14}
\end{equation*}
$$

where,
SEM = Standard Error of Measurement
CSEM = Conditional Standard of Measurement
$N_{j}=$ number of examinees obtaining score $j$ in the population
$N_{T}=$ total number of students in test sample
SEM was computed for each of the OCCT assessments. Table 6-6 presents the overall estimates of SEM for each of the content areas for the Spring 2012 administration.

Spring 2012 Soci Grade 8 Scale Score Distribution

[^0]:    ${ }^{1}$ The Mathematics PASS standards were revised in 2009-2010 and required significant changes to the test blueprints, and thus required significant changes to the OCCT Mathematics item bank.
    ${ }^{2}$ While the Reading PASS standards that are assessed by OCCT are the same, the enumeration of these standards is slightly different in grade 3.
